

# TRANSITION METAL IONS

IA		TRANSITION METAL IONS										VIII A						
H	IIA												III A	IV A	V A	VIA	VII A	He
Li	Be											B	C	N	O	F	Ne	
Na	Mg	IIIB	IVB	VB	VIB	VII B	VIII B		IB	IIB	Al	Si	P	S	Cl	Ar		
K	Ca	Sc	Ti	V	Cr	Mn	Fe	Co	Ni	Cu	Zn	Ga	Ge	As	Se	Br	Kr	
Rb	Sr	Y	Zr	Nb	Mo	Tc	Ru	Rh	Pd	Ag	Cd	In	Sn	Sb	Te	I	Xe	
Cs	Ba	* La	Hf	Ta	W	Re	Os	Ir	Pt	Au	Hg	Tl	Pb	Bi	Po	At	Rn	
Fr	Ra	* Ac	Rf	Db	Sg	Bh	Hs	Mt	*"inner" transition metals go here									

The transition metals always form CATIONS!

However, many transition metals are capable of forming SEVERAL DIFFERENT CATIONS!

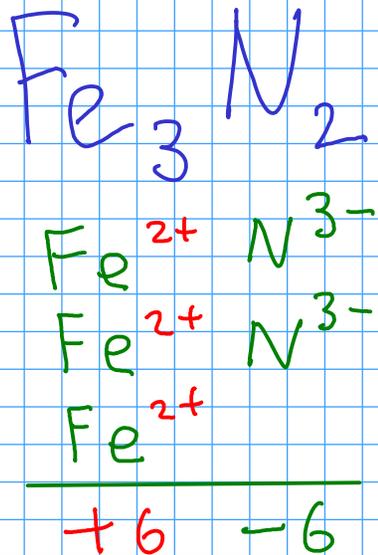

Example: Iron (Fe) forms two cations, depending on the situation: Fe<sup>2+</sup> or Fe<sup>3+</sup>

## TRANSITION METAL CATIONS

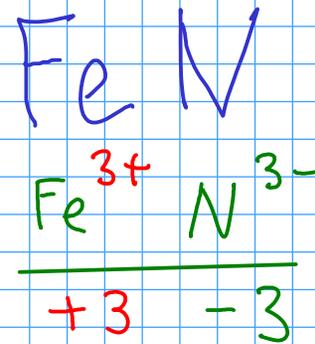

- So how do you know which cation you're dealing with? For now, you'll have to be told

- Either the chemical formula of an ionic compound or the name of an ionic compound can tell you what charge is on the transition metal cation.

Examples:

\* This form of iron has a +2 charge and is called "iron(II)"!

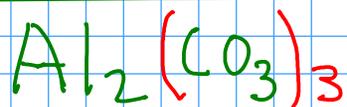

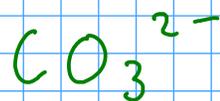

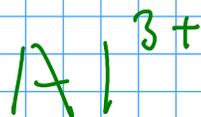

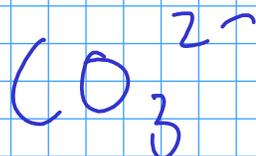

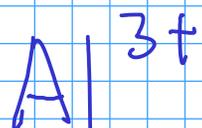

\* This form of iron has a +3 charge and is called "iron(III)"!

## POLYATOMIC IONS

- Some MOLECULES can gain or lose electrons to form CATIONS or ANIONS. These are called POLYATOMIC IONS

- Polyatomic ions form ionic compounds in the same way that single-element ions do.

Example:

\* Use parenthesis when an ionic compound's formula contains more than one of a polyatomic ion.

**YOU MUST MEMORIZE THE NAMES AND FORMULAS OF THE MOST COMMON POLYATOMIC IONS. CHECK THE COURSE WEB SITE FOR A LIST!**

## NAMES OF IONS

- To properly discuss ions and ionic compounds, we have to know how to name them!

### CATIONS

3 kinds:

① Main group cations (metals that take only one charge when forming ions)

- The element's name is the same as the ion's name!

② Transition metal cations (from metals that can form several cations)

- The CHARGE of the cation must be given. Use a ROMAN NUMERAL after the element name to indicate charge!

③ Polyatomic cations

- Memorize list.

# ANIONS

2 kinds

1

Main-group nonmetals

- Use the STEM NAME of the element, then add "-ide" suffix

$\text{N}^{3-}$  : "nitride" ion

$\text{P}^{3-}$  : "phosphide ion"

$\text{S}^{2-}$  : sulfide ion

$\text{O}^{2-}$  : "oxide ion"

$\text{F}^{-}$  : "fluoride ion"

---

2.

Polyatomic ions

- Memorize list. (see web site, also see Ebbing/Wentworth p133)

$\text{C}_2\text{H}_3\text{O}_2^-$  : "acetate ion"

$\text{SO}_4^{2-}$  : "sulfate ion"

$\text{NO}_3^-$  : "nitrate ion"

$\text{SO}_3^{2-}$  "sulfite ion"

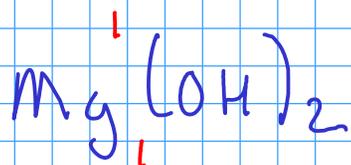

$\text{NO}_2^-$  : "nitrite ion"

\* Polyatomic ions ending in "-ate" and "-ite" suffixes always contain oxygen! "-ate" ions have more oxygen atoms than their "-ite" counterparts.

## NAMING IONIC COMPOUNDS

- The name of the compound is based on the name of the ions in the compound
- Cation first, anion second

Examples:

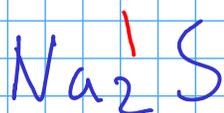

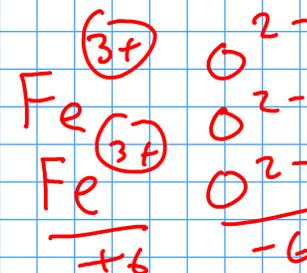

magnesium hydroxide

---

iron(III) oxide

---

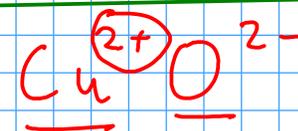

sodium sulfide

---

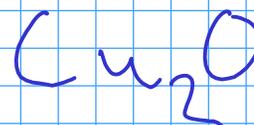

copper(II) oxide

---

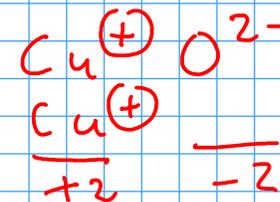

beryllium bromide

---

copper(I) oxide

---

Remember to include the Roman numeral for CHARGE in the name of transition metal compounds!
