

IONIC COMPOUNDS

- ionic compounds are held together by ELECTROSTATIC INTERACTIONS

(in other words, the attraction between oppositely charged ions!)

Each chloride ion is
strongly attracted to ALL
of the sodium ions
surrounding it!

Each sodium ion is
strongly attracted to ALL
of the chlorine atoms
surrounding it!

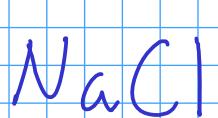

There are no "molecules" in ionic compounds - in the sense that
you can't point to a discrete unit of atoms that are connected to only
each other

IONIC FORMULAS

- since there are no "molecules", an ionic formula cannot describe how many and what kinds of atoms are in a molecule!
- all ionic compounds are observed to be (overall) electrically neutral, so the IONS they contain must be present in such a way that the charges **BALANCE EACH OTHER**
- an ionic formula gives the **SIMPLEST WHOLE NUMBER RATIO OF CATION TO ANION** in the ionic compound

(2 : 3 ratio)

WRITING AN IONIC FORMULA

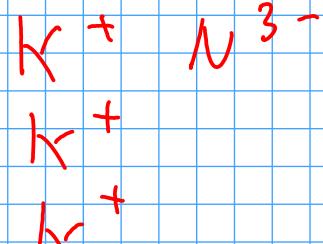

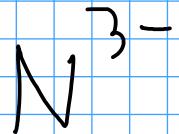

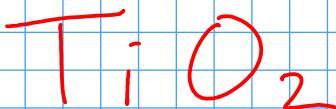

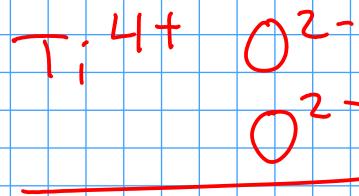

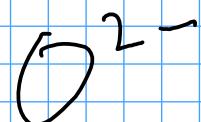

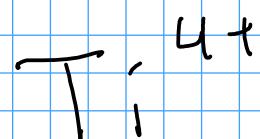

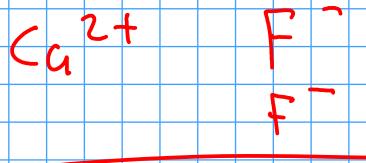

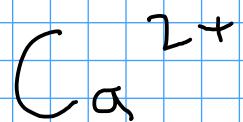

- if you know the ions that make up a compound, all you need to do is find the smallest ratio of cation to anion the compound needs to have an overall charge of zero

Example:

Ionic formulas are **ALWAYS** written with the cation first, and the anion second!

More examples:

You can also use the "cross method", as described in your textbook, to write formulas. Use caution, as the "cross method" will sometimes give you the wrong formula! It would give you the wrong answer for this one!

PREDICTING CHARGES

- how do you figure out the charge that an element might take when it becomes an ion?
- for many main group elements, you can predict the charge using the periodic table!

IA														VIIIA			
H	IIA													He			
Li	Be																
Na	Mg	IIIB	IVB	VB	VIB	VIIB	VIIIB	IB	IIB	Al	Si	P	S	Cl	Ar		
K	Ca	Sc	Ti	V	Cr	Mn	Fe	Co	Ni	Cu	Zn	Ga	Ge	As	Se	Br	Kr
Rb	Sr	Y	Zr	Nb	Mo	Tc	Ru	Rh	Pd	Ag	Cd	In	Sn	Sb	Te	I	Xe
Cs	Ba	* La	Hf	Ta	W	Re	Os	Ir	Pt	Au	Hg	Tl	Pb	Bi	Po	At	Rn
Fr	Ra	* Ac	Rf	Db	Sg	Bh	Hs	Mt									

* "inner" transition metals go here

Elements in group VIIIA - the "noble gases" - do not form ions!

Many OTHER main-group elements form either anions or cations that have the same overall number of electrons as the NEAREST (in terms of atomic number) noble gas!

PREDICTING CHARGE

IA	IIA											VIIIA					
H	Be											He					
Li	Mg	IIIIB	IVB	VB	VIB	VIIIB	—	VIIIB	—	IB	IIB	Al	10				
Na		Sc	Ti	V	Cr	Mn	Fe	Co	Ni	Cu	Zn	Si	18				
K	Ca										Ga	Ge	As	Se	Br	36

Fr	Ra	Ac	Rf	Db	Sg	Bh	Hs	Mt	* "inner" transition metals go here								

Aluminum (Al): At atomic number 13, it is three electrons away from neon (Ne), and 5 electrons away from argon (Ar). Prediction: Aluminum will lose three electrons to form the cation Al^{3+}

Bromine (Br): At atomic number 35, bromine is one electron away from krypton (Kr). Prediction: Bromine will gain one electron to form the anion Br^-

Strontium (Sr): At atomic number 38, strontium is two electrons away from krypton. Prediction: Strontium will lose two electrons to form the cation Sr^{2+}

EXAMPLES

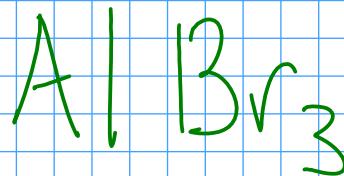

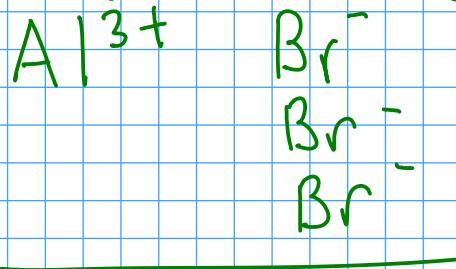

* "inner" transition metals go here

Find the formulas of:

- (1) an ionic compound containing Al and Br
- (2) an ionic compound containing Mg and O
- (3) an ionic compound containing S and K

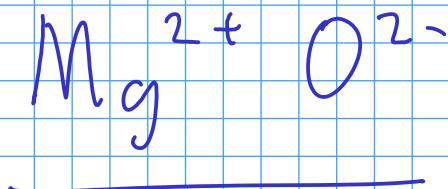

Find the formula of:

* an ionic compound containing Al and Br

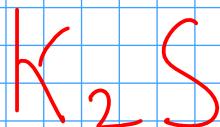

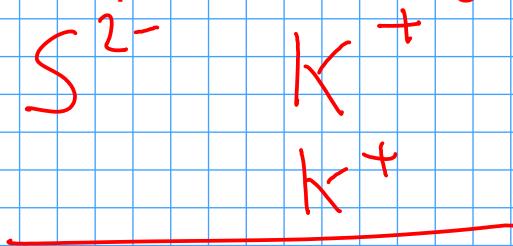

Find the formula of:

* an ionic compound containing Mg and O

Find the formula of:

* an ionic compound containing S and K

Write CATION first in ionic formulas!

Cs	Ba	La	Hf	Ta	W	Re	Os	Ir	Pt	Au	Hg	Tl	Pb	Bi	Po	At	Rn	
Fr	Ra	Ac	Rf	Db	Sg	Bh	Hs	Mt										

*"inner" transition metals go here

The transition metals always form CATIONS!

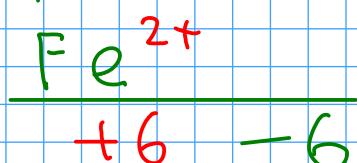

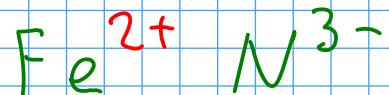

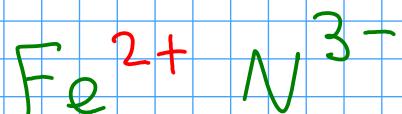

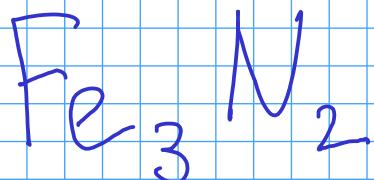

However, many transition metals are capable of forming SEVERAL DIFFERENT CATIONS!

Example: Iron (Fe) forms two cations, depending on the situation: Fe^{2+} or Fe^{3+}

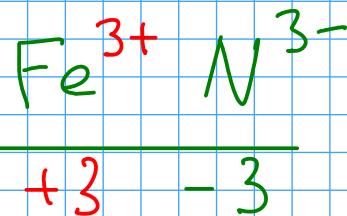

TRANSITION METAL CATIONS

- So how do you know which cation you're dealing with? For now, you'll have to be told
- Either the chemical formula of an ionic compound or the name of an ionic compound can tell you what charge is on the transition metal cation.

Examples:

* This form of iron has a +2 charge
and is called "iron(II)"!

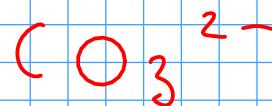

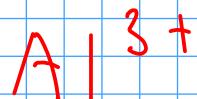

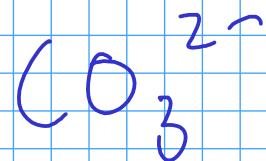

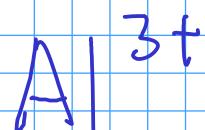

* This form of iron has a +3 charge
and is called "iron(III)"!

POLYATOMIC IONS

- Some MOLECULES can gain or lose electrons to form CATIONS or ANIONS. These are called POLYATOMIC IONS

- Polyatomic ions form ionic compounds in the same way that single-element ions do.

Example:

* Use parenthesis when an ionic compound's formula contains more than one of a polyatomic ion.

YOU MUST MEMORIZE THE NAMES AND FORMULAS OF THE MOST COMMON POLYATOMIC IONS. CHECK THE COURSE WEB SITE FOR A LIST!

NAMES OF IONS

- To properly discuss ions and ionic compounds, we have to know how to name them!

CATIONS

3 kinds:

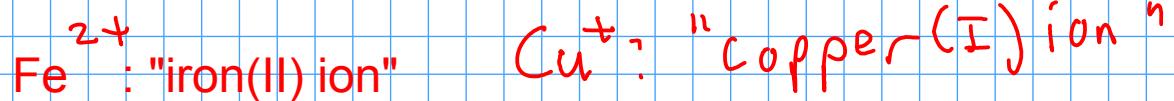

(1) Main group cations (metals that take only one charge when forming ions)

- The element's name is the same as the ion's name!

(2) Transition metal cations (from metals that can form several cations)

- The CHARGE of the cation must be given. Use a ROMAN NUMERAL after the element name to indicate charge!

(3) Polyatomic cations

- Memorize list.

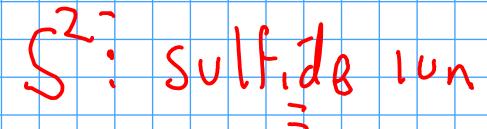

ANIONS

2 kinds

1

Main-group nonmetals

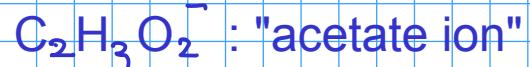

- Use the STEM NAME of the element, then add "-ide" suffix

2.

Polyatomic ions

- Memorize list. (see web site)

* Polyatomic ions ending in "-ate" and "-ite" suffixes always contain oxygen! "-ate" ions have more oxygen atoms than their "-ite" counterparts.
