$0.100 \mathrm{M} \mathrm{NH}_{4} \mathrm{Cl}$... Find the pH of the solution

$$
\mathrm{NH}_{4} \mathrm{Cl} \rightarrow \mathrm{NH}_{4}^{+}+\mathrm{Cl}^{-}
$$

Acidic, basic, or neutral salt?
This is the WEAK BASE ammonia. Stable $\longleftarrow$ in water.

$$
\begin{aligned}
& \mathrm{NH}_{4}{ }^{+}: \mathrm{NH}_{4}{ }^{+}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{NH}_{3}+\mathrm{H}_{3} \mathrm{O}^{+} \\
& \mathrm{Cl}^{-}: \mathrm{Cl}^{-}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \overline{\mathrm{HCl}}+\mathrm{OH}^{-X}
\end{aligned}
$$

This sa strong ACID, which apes nor exist as a stable molecule in water. The conjugate of a strong acid or base is NEUTRAL - does not affect pH!

$$
\mathrm{NH}_{4}{ }^{+}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{NH}_{3}+\mathrm{H}_{3} \mathrm{O}^{+} \text {This equilibrium affects the } \mathrm{pH} \text {, so it is the }

POLYPROTIC ACIDS

Find pH of $0.10 \mathrm{M} \mathrm{H}_{3} \mathrm{PO}_{4}$
... what's special about phosphoric acid?
(1) $\mathrm{H}_{3} \mathrm{PO}_{4}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{H}_{2} \mathrm{PO}_{4}^{-}+\mathrm{H}_{3} \mathrm{O}^{+}$ Phosphoric acid has THREE acidic protons!
(2) $\mathrm{H}_{2} \mathrm{PO}_{4}^{-}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{HPO}_{4}^{2-}+\mathrm{H}_{3} \mathrm{O}^{+}$
(3)

$$
\mathrm{HPO}_{4}^{2-}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{PO}_{4}^{3-}+\mathrm{H}_{3} \mathrm{O}^{+}
$$

$$
\begin{aligned}
& K_{a_{1}}=6,9 \times 10^{-3} \\
& K_{a_{2}}=6,2 \times 10^{-8} \\
& K_{a_{3}}=4,8 \times 10^{-13}
\end{aligned}
$$

The first dissocation is dominant here, and for simple calculations of phosphoric acid in water, we will simply use the first ionization and ignore the other two.

Remember: This is a weak acid. It exits in water mostly as undissociated phosphoric acid molecules.

Solving the equilibrium of phosphoric acid's first proton:

$$
\begin{aligned}
& \mathrm{H}_{3} \mathrm{PO}_{4}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{H}_{2} \mathrm{PO}_{4}^{-}+\mathrm{H}_{3} \mathrm{O}^{+} \\
& K_{a}=6.9 \times 10^{-3}=\frac{\left[\mathrm{H}_{2} \mathrm{PO}_{4}-\right]\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]}{\left[\mathrm{H}_{3} \mathrm{PO}_{4}\right]} \\
& \frac{x^{2}}{0.10-x}=6.9 \times 10^{-3}
\end{aligned}
$$

For this problem, the assumption that $x \ll 0.10$ might not be safe (Ka is fairly large for a weak acid), so we should solve the quadratic instead...

$$
\begin{aligned}
& x=0.023043 \text { or }-0.024943 \\
& {\left[\mathrm{H}_{3} \mathrm{O}+\right]=\frac{0.023043 \mathrm{~m}}{\mathrm{PH}=1.64 \quad \text { Less than 0. 10, but not }} \begin{array}{l}
\text { MUCH less! }
\end{array}}
\end{aligned}
$$
