Measurements

Measurements are comparisons of properties against accepted standards, called units.

ENGLISH / US SYSTEM OF UNITS:

1 foot =
$$12$$
 inches

1 yard = 3 ft

1 mile = 1760 yd

 1260 ft = 12 mi

So what's the problem? The English system of units is an inconsistent mess. Units don't relate to one another in a meaningful way. Plus, each kind of unit has its own set of conversions to memorize.

English units are nonstandard and difficult to use. Solution?

THE METRIC SYSTEM

Metric Base Units:

Length		meter	m
Mass		X kilogram	kg
Temperature		Kelvin	K
Time		second	S

All metric units are made up of COMBINATIONS of BASE UNITS!

*we usually treat the gram as if it's the base unit for mass!

- One meter is approximately 3.3 feet.
- One kilogram is approximately 2.2 pounds.

What about SIZE?

A few common metric prefixes:

mega-	10 6	М
kilo-	3 10	k
centi-	-2. 10	С
milli-	10 3	m
micro-	10 -6	M

Bigger units

MEMORIZE the common metric prefixes listed in the study guide

smaller units

Applying prefixes

The distance between here and Columbia, SC is about 107,000 meters. What metric unit would be best suited for a distance like this?

A piece of chalk is 0.080 meters long. What metric unit would be best suited for this length?

suited for this length?
$$C = 10^{-2} \quad (m = 10^{-2} m \left(\frac{1}{100} m \right)$$

Derived Units

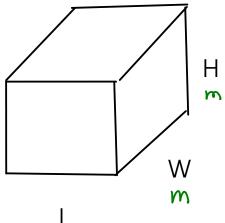

- are units that are made up of combinations of metric <u>base units</u> with each other and/or with <u>prefixes</u>

$$Velocity: \frac{miles}{hr} \quad \frac{km}{s} \qquad \left(\frac{m}{s}\right) \qquad \frac{length}{time}$$

Two derived units are particularly important in general chemistry:

- 1) VOLUME
- 2) DENSITY

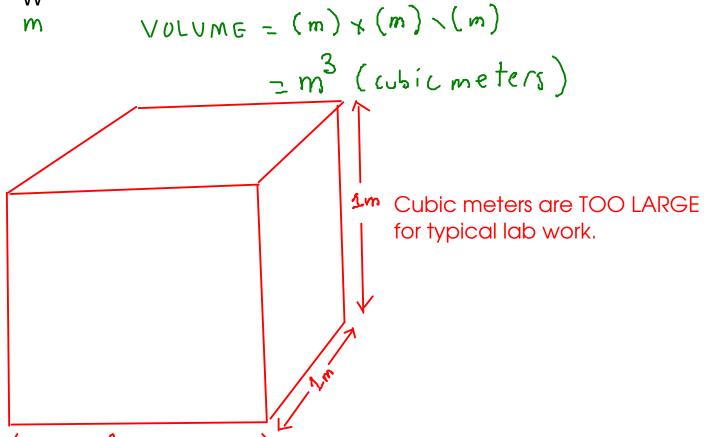

VOLUME

m

$$VOLUME = L \times W \times H$$

What are the units of volume in the metric system?

Practical issues for volume units

- Cubic meters are too large! A meter is very similar in length to a yard, so a cubic meter is a cube that is approximately a yard long on each side!

Cubic <u>decimeters</u> are given the name <u>"liters"</u>, abbreviation <u>"L"</u> In the lab, we typically need an even smaller unit than the liter, so we use <u>milliliters</u> (mL)

7

DENSITY

- Density is a measure of the concentration of matter; of how much matter is present in a given space
- Density is defined as the MASS per unit VOLUME, or ...

What are the metric units of DENSITY?

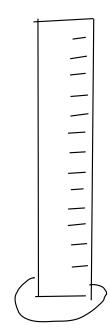

... but we typically don't measure in either kilograms or cubic meters in the lab. (Example: Our scales in the lab have a maximum capacity of about 0.200 kg) 9

In the lab, we typically measure masses as grams and volumes as milliliters, so the density unit we will use most often is:

$$\frac{9}{\text{mL}} \qquad \left(\frac{9}{\text{cm}^3}\right)$$

A useful density to remember: WATER at room temp: Density = 1 9/mL

... of a liquid

1) Measure mass of empty cylinder

mass = 97.35 g

2) Fill cylinder and measure volume of liquid

3) Measure mass of filled cylinder

4) Subtract to find mass of liquid

5) Density = mass liquid / volume liquid

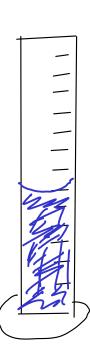

Density =
$$\frac{33.20 \text{ g}}{28.3 \text{ mL}}$$

= $|1.3| \frac{9}{\text{mL}}$

...of an object

1) Measure mass of object

2) Partially fill cylinder with liquid, record volume.

4) Subtract to find volume of object

5) Density = mass object / volume object

Density =
$$\frac{9.18}{1.6} = \frac{9}{mL}$$

= $6.1 = \frac{9}{mL}$
