### Matter

- anything that takes up space and can be perceived! What about the structure of matter? Matter as atoms!

THE PHASES OF MATTER

small particles that are the building blocks of matter

### SOLIDS

- \* Rigid: Fixed shape AND fixed volume
- \* Dense: contain much mass in a given volume!

LIQUIDS

- \* Variable shape ("fluid")
- \* Fixed volume
- \* Dense

#### GASES

- \* Variable shape ("fluid")
- \* Variable volume

١

\* Not dense ("diffuse")

# Solids:

- fixed shape, dense, fixed volume

- Atoms closely packed
- Atoms are arranged in a regular structure (a CRYSTAL), giving the solid rigidity
- Atoms are strongly attracted to each other, keeping the solid together
- Atoms do not move about freely, but there is some vibration

Liquids:

- variable shape, dense, fixed volume

- Atoms still very close to each other, but usually a little farther apart than in solid phase An exception: Water.

- Atoms are not arranged in an overall order and can slide past and around one another

- Atoms are still strongly attracted to each other, keeping the liquid together

- Atoms move around each other constantly  $\checkmark$ 

Evidence: DIFFUSION - a drop of food coloring in a glass of water will eventually spread throughout the glass, even if the glass is NOT stirred.

Gases:

- variable shape, diffuse (not dense), variable volume

- Atoms are spread far apart
- No structure

- Atoms are NOT strongly attracted to each other. They don't interact much <u>at all</u>, unless they happen to collide.

- Atoms in constant, rapid motion. The speed of the atoms increases as temperature increases.

Gases take the shape of their containers. Collision of atoms/molecule of gas with the walls of their containers create the effect we call PRESSURE.

<u>Kinetic theory</u>

43

- describes matter in terms of atomic/molecular MOTION

- the energy of the molecules relates to atomic/molecular motion, and temperature

You can speed up the molecules (add energy) by heating! You can slow down the molecules (remove energy) by cooling! - We classify changes in matter according to whether the identity of matter changes during the process.

# PHYSICAL CHANGE

- A change in the form or appearance of matter WITHOUT a change in identity

#### Examples:

- Melting, freezing (all phase changes) are physical; changes
- Breaking, cutting, etc. are also physical changes

# CHEMICAL CHANGE

- A change in the identity of matter
- also called "chemical reactions"

### Examples:

- Burning, rusting, metabolism

We classify PROPERTIES of substances by whether or not you must change the identity of a substance to obtain information about the property

## PHYSICAL PROPERTIES

- can be determined without changing the identity of matter

Examples:

- size, shape, color, mass, hardness
- melting point, boiling point, density, etc.

CHEMICAL PROPERTIES

- can only be determined by changing the identity of matter

Examples:

- flammability, reactivity with acids, temperature at which thermal decomposition occurs - We can broadly classify matter by how difficult it is to separate

PURE SUBSTANCES

- CANNOT be separated into different materials by PHYSICAL PROCESSES

Examples:

Table salt, gold, silver, nitrogen, oxygen, carbon, hydrochloric acid, carbon dioxide, ethanol (grain alcohol), water, silicon dioxide MIXTURES

- CAN be separated into other materials by PHYSICAL PROCESSES

Examples:

salt water, vodka, air, toilet bowl cleaner, beef, macaroni and cheese, dirt

- Pure substances can be further classified, depending on how easy it is to separate them by CHEMICAL PROCESSES

# ELEMENTS

- Cannot be broken down into simpler substances using physical or chemical means

- Elements are the building blocks of chemistry! They are the simple things from which all other things are formed!

- Listed on the PERIODIC TABLE OF THE ELEMENTS

Examples:

gold, silver, carbon, nitrogen, oxygen

## COMPOUNDS

-Can be broken down into simpler substances using chemical means

- Are made of ELEMENTS combined in simple, fixed ratios

- A compound, no matter how it was made, has a definite ratio of one atom to another (LAW OF CONSTANT COMPOSITION)

 $H_2O$ : 2 parts hydrogen to one part oxygen!

## Examples:

carbon dioxide, hydrochloric acid, ethanol, water

More on MIXTURES

- Mixtures can be further classified based on uniformity

HOMOGENEOUS MIXTURES

- uniform in composition and properties throughout
- physical properties the same at any point in the mixture

### Examples:

salt water, toilet bowl cleaner, vodka

HETEROGENEOUS MIXTURES

- nonuniform

physical properties may differ
(sometimes dramatically) at different
points in the mixture

Examples:

beef, dirt, macaroni and cheese

49

#### Conservation of mass

- During any chemical or physical process, the overall amount of mass remains constant, even if the chemical identity or physical state of the matter involved changes

\* Total mass remains constant from (1) to (2), even though the mass of the GAS decreases and the mass of the SOLID increases after combustion!

End of material for Test #1
