

## Conservation of mass

- During any chemical or physical process, the overall amount of mass remains constant, even if the chemical identity or physical state of the matter involved changes

\* Total mass remains constant from (1) to (2), even though the mass of the GAS decreases and the mass of the SOLID increases after combustion!

End of material for Test #1

Test 1: 6/3/2010

Chapters 1, 2, 3

## DALTON'S ATOMIC THEORY

- 1808: Publication of Dalton's "A New System of Chemical Philosophy", which contained the atomic theory

- Dalton's theory attempted to explain two things:

①

CONSERVATION OF MASS

②

LAW OF DEFINITE PROPORTIONS (also called the LAW OF CONSTANT COMPOSITION): All pure samples of a given compound contain the same proportion of elements by mass

---

## The parts of Dalton's theory

- ① Matter is composed of small, chemically indivisible ATOMS
- ② ELEMENTS are kinds of matter that contain only a single kind of atom. All the atoms of an element have identical chemical properties.
- ③ COMPOUNDS are kinds of matter that are composed of atoms of two or more ELEMENTS which are combined in simple, whole number ratios.  
*1:1 or 1:2 or 2:3, etc.*

Most importantly,

- ④ CHEMICAL REACTIONS are REARRANGEMENTS of existing atoms to form new compounds.
  - Atoms are not gained or lost during a chemical reaction.
  - Atoms do not change their identity during a chemical reaction.
  - All the atoms that go into a chemical reaction must go out again!

## Another look at chemical reactions

You observed this reaction in the oxygen lab:

... but wouldn't this mean that somehow an extra oxygen atom would form?

Not according to Dalton's theory. Dalton's theory would predict a different RATIO of water and oxygen would form:

- Dalton's theory sets LIMITS on what can be done with chemistry. For example:

- ① Chemistry can't convert lead (an element) into gold (another element). Sorry, alchemists!
- ② You can't have a compound form in a chemical reaction that contains an element that was not in your starting materials.
- ③ You can only make a certain amount of desired product from a fixed amount of starting material.

... but Dalton's theory said nothing about WHY atoms behave the way they do. What makes gold ... gold?

## Atomic structure

- Until the early 20th century, chemists considered atoms to be indivisible particles.
- The discovery of SUBATOMIC PARTICLES changed the way we view atoms!

### The subatomic particles

#### PROTON

- a small, but relatively massive particle that carries an overall unit POSITIVE CHARGE

#### NEUTRON

- a small, but relatively massive, particle that carries NO CHARGE
- slightly more massive than the proton

#### ELECTRON

- a small particle that carries an overall unit NEGATIVE CHARGE
- about 2000 times LESS massive than either protons or neutrons

... So these particles were all thought to be parts of the atom. But how were these parts put together?

## Putting it together...

- In the early 20th century, there was a debate on the structure of the atom.

### RUTHERFORD EXPERIMENT (1911)

Where do the particles go?

Most particles pass through foil, undeflected

A few particles slightly deflected

\* This experiment was performed after the discovery of the electron, but before the discovery of the proton or neutron!  
(1919) (1932)

## NUCLEAR MODEL

- Atoms are mostly empty space
- NUCLEUS, at the center of the atom, contains protons and neutrons. This accounts for almost all the mass of an atom
- Electrons are located in a diffuse ELECTRON CLOUD surrounding the nucleus
