105
25.0 mL of acetic acid solution requires 37.3 mL of 0.150 M sodium hydroxide for complete reaction. The equation for this reaction is:

$$
\mathrm{NaOH}+\mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2} \rightarrow \mathrm{NaC} 2 \mathrm{H}_{3} \mathrm{O}_{2}+\mathrm{H}_{2} \mathrm{O}
$$

What is the molar concentration of the acetic acid?

$$
\frac{L \text { mol } \mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}}{L \text { Solution }}=25.0 \mathrm{~mL} \text { or } 0.0250 \mathrm{~L}
$$

Since we already know the volume of acetic acid solution, we need to calculate the moles of acetic acid if we want to find out the concentration.

$$
0.180 \mathrm{~mol} \mathrm{NaOH}=L \quad \operatorname{mol} \mathrm{NaOH}=\operatorname{mol} \mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}
$$

units: 37.3 mL NaOH solution $=0.0373 \mathrm{~L} \mathrm{NaH} \mathrm{solution}$

$$
0.0373 L \times \frac{0.180 \mathrm{~mol} \mathrm{NaOH}}{L} \times \frac{\mathrm{mol} \mathrm{HC}}{2} \mathrm{H}_{3} \mathrm{O}_{2}=0.005585 \mathrm{molHC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}
$$

To get molarity, divide moles of acetic acid and volume:

$$
M=\frac{\text { mol } \mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}}{L \text { Solution }}=\frac{0.005585 \text { mol } \mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}}{0.0250 \mathrm{~L}}=0.224 \mathrm{MHC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}
$$

Shortcut: Use millimoles

$$
\begin{aligned}
& 37.3 \mathrm{~mL} \times \frac{0.150 \mathrm{~mol} \mathrm{NaOH}}{L} \times \frac{\mathrm{mol} \mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}}{m o l ~ \mathrm{NaOH}}=5.54 \mathrm{Smmol} \mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2} \\
& M=\frac{\text { mol } \mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}}{L \text { Solution }}=\frac{\mathrm{mal}}{\mathrm{~mL}}=\frac{5.54 \mathrm{Smol} \mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}}{25.0 \mathrm{~mL}}=0.224 \mathrm{MHC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}
\end{aligned}
$$

$$
4 \underset{\substack{\text { a } \\ \text { propylene }}}{42.081 \mathrm{~g} / \mathrm{mul}}+6 \mathrm{NO} \longrightarrow \underset{\substack{\text { acrylonitrile }}}{\mathrm{C}_{3}^{53.064} \mathrm{H}_{3}^{\mathrm{g} / \mathrm{mul}}+6 \mathrm{H}_{2} \mathrm{O}}+\mathrm{N}_{2}
$$

Calculate how many grams of acrylonitrile could be obtained from 651 kg of propylene, assuming there is excess NO present.

$$
(6 \$ 1000 \mathrm{~g})
$$

1 - Convert mass propylene to moles. Use formula weight of propylene.
2 - Convert moles propylene to moles acrylonitrile. Use chemical equation.
3 - Convert moles acrylonitrile to mass acrylonitrile. Use formula weight of acrylonitrile.
$42.081 \mathrm{gC}_{3} \mathrm{H}_{6}=\mathrm{mol} \mathrm{C}_{3} \mathrm{H}_{6} \quad 4 \mathrm{~mol} \mathrm{Cl}_{3} \mathrm{H}_{6}=4 \mathrm{~mol} \mathrm{C}_{3} \mathrm{H}_{3} \mathrm{~N} \mid 53.064 \mathrm{~g} \mathrm{C}_{3} \mathrm{H}_{3} \mathrm{~N}=\mathrm{mol}_{3} \mathrm{H}_{3} \mathrm{~N}$

$$
651000 \mathrm{gC}_{3} \mathrm{H}_{6} \times \frac{\mathrm{molC}_{3} \mathrm{H}_{6}}{42.081 \mathrm{gC}_{3} \mathrm{H}_{6}} \times \frac{4 \mathrm{~mol} \mathrm{C}_{3} \mathrm{H}_{3} \mathrm{~N}}{4 \mathrm{~mol} \mathrm{C}_{3} \mathrm{H}_{6}} \times \frac{53.064 \mathrm{~g} \mathrm{C}}{3} \mathrm{H}_{3} \mathrm{~N},
$$

$$
\begin{equation*}
=821000 \mathrm{~g} \mathrm{C}_{3} \mathrm{H}_{3} \mathrm{~N}\left(851 \mathrm{~F}_{g}\right) \tag{2}
\end{equation*}
$$

$$
\begin{aligned}
& \\
& \begin{array}{ll}
10 \mathrm{FeSO}_{4}
\end{array}+\underline{\mathrm{KMnO}_{4}}+8 \mathrm{H}_{2} \mathrm{SO}_{4} \rightarrow \mathrm{SF}_{2}\left(\mathrm{SO}_{4}\right)_{3}+2 \mathrm{mnSO}_{4}+\mathrm{K}_{2} \mathrm{SO}_{4} \\
&+ 8 \mathrm{H}_{2} \mathrm{O}
\end{aligned}
$$

How many mL of 0.250 M potassium permangenate are needed to react with 3.36 g of iron(II) sulfate?
1 - Convert mass of iron(II) sulfate to moles using formula weight.
2 - Convert moles of iron(II) sulfate to moles potassium permangenate using chemical equation.
3 - Convert moles potassium permangenate to volume solution using concentration ( 0.250 M )

$$
\begin{aligned}
& =17.7 \mathrm{~mL} \text { of } 0,250 \mathrm{mkmnon}
\end{aligned}
$$

- electrolytes: substances that dissolve in water to form charge-carrying solutions
* Electrolytes form ions in solution - (ions that are mobile are able to carry charge!). These IONS can undergo certain kinds of chemistry!

IONIC THEORY

- the idea that certain compounds DISSOCIATE in water to form free IONS

What kind of compounds?

- Soluble ionic compounds
- Acids (strong AND weak)
- Bases (strong AND weak)

The ions formed may interact with each other to form NEW compounds!

Strong vs weak?

- If an electrolyte COMPLETELY IONIZES in water, it's said to be STRONG
- If an electrolyte only PARTIALLY IONIZES in water, it's said to be WEAK
- Both kinds of electrolyte undergo similar kinds of chemistry.
Simple
conductivity
tester: The
stronger the
electrolyte, the
brighter the light.

SOME PURE COMPOUNDS (MOLECULAR AND IONIC)
DISTILLED WATER No light. Pure water does not conduc $\dagger$ electricity (NONELECTROLYTE)

## SOLID SODIUM CHLORIDE

Contains ions, but the ions are locked into the crystal structure of the solid and cannot move freely. No light.
SOLID SUCROSE $C_{12}{ }^{H_{22}} \mathrm{O}_{11}$
No light. Like water, sucrose is a molecular substance. No charge carriers.

MOLECULAR AND IONIC SOLUTIONS

## SODIUM CHLORIDE + WATER

Bright light. Sodium chloride is a STRONG ELECTROLYTE - it breaks apart in water to form free ions!
SUCROSE + WATER
No light. The sugar water does not conduct, and sugar is a NONELECTROLYTE. A sucrose solution exists as dissolved molecules; no ions form.
ACIDS
PURE (GLACIAL) ACETIC ACID
No light. Pure acetic acid is a nonconductor. This means that in the liquid state, there are no ions present. Acetic acid must therefore be a MOLECULE.

## ACETIC ACID + WATER

Bulb lights, but somewhat dim. Acetic acid is a WEAK ELECTROLYTE. (Acetic acid must react with water to make ions, but not all of the acid ionizes)
2M ACETIC ACID (AQUEOUS)
Light bulb lights, but is dim. WEAK ELECTROLYTE
2M HYDROCHLORIC ACID (AQUEOUS)
Light bulb lights brightly. STRONG ELECTROLYTE. (Or, at the very least hydrochloric acid is a much stronger electrolyte than acetic acid is!). HCl is considered to be a strong electrolyte like NaCl
