

How many significant figures are there in each of these measurements?

$$\frac{76.070}{5} \text{ g } \pm 0.001 \text{ g}$$

$$\frac{85000.}{5} \text{ mm } \pm 1 \text{ mm}$$

↑
decimal point

$$\frac{0.001030}{4} \text{ kg } \pm 0.000001 \text{ kg}$$

$$\frac{156.0002}{7} \text{ g } \pm 0.0001 \text{ g}$$

$$\frac{0.10}{2} \text{ s } \pm 0.01 \text{ s}$$

$$\frac{17000000}{2} \text{ mg } \pm 1000000 \text{ mg}$$

marked!

$$\frac{120\bar{0}00}{4} \text{ km } \pm 100 \text{ km}$$

$$\frac{1350}{3} \text{ ms } \pm 10 \text{ ms}$$

(Number of significant figures is indicated in RED below each measurement. Significant digits are UNDERLINED.)

(Approximate uncertainty in each of these measurements is indicated in GREEN after each one.)

Calculations with measurements

When you calculate something using measured numbers., you should try to make sure the ANSWER reflects the quality of the data used to make the calculation.

An ANSWER is only as good as the POOREST measurement that went into finding that answer!

$$\begin{array}{r}
 14.20\bar{6} \\
 154.7\bar{2} \\
 + 1.\bar{6} \\
 + 0.22\bar{2} \\
 \hline
 170.74\bar{8}
 \end{array}$$

Round so that there's only one uncertain digit in the answer!

How should we report this answer? How much uncertainty is in this answer?

$$170.7$$

- * If you add an uncertain number to either a certain or an uncertain number, then the result is uncertain!
- * If you add certain numbers together, the result is certain!

For addition and subtraction, round FINAL ANSWERS to the same number of decimal places as the measurement with the fewest decimal places. This will give an answer that indicates the proper amount of uncertainty.

For multiplication and division, round FINAL ANSWERS to the same number of SIGNIFICANT FIGURES as the measurement with the fewest SIGNIFICANT FIGURES!

$$\overset{4}{\underline{15.62}} \times \overset{3}{\underline{0.0667}} \times \overset{3}{\underline{35.0}} = 36.46489$$

How should we report this answer?

36.5

$$\overset{3}{\underline{25.4}} \times \overset{2}{\underline{0.00023}} \times \overset{5}{\underline{15.201}} = 0.088804242$$

How should we report this answer?

0.089

Leading zeros aren't considered significant, so the first significant figure is the first '8'!

A few more math with significant figures examples:

$$\overset{5}{15047} \times \overset{2}{11} \times \overset{4}{0.9876} = 163464.5892$$

~~16~~

160000
 1.6×10^5

Placeholder zeros, even though they aren't SIGNIFICANT, still need to be included, so we know how big the number is!

$$\begin{array}{r} 147.3 \\ 2432 \\ 0.97 \\ + 111.6 \\ \hline 2691.87 \end{array}$$

2692

DENSITY
 CALCULATION

$$\begin{array}{r} \overset{6}{14.7068 \text{ g}} \\ \hline \underset{2}{2.7 \text{ mL}} \end{array}$$

$$= 5.446962963 \text{ g/mL}$$

5.4 g/mL

To improve (make more precise) this calculated density, we must improve the poorest measurement. We must use a more precise device to measure the VOLUME (which only has two significant figures in this example)!

Exact Numbers

- Some numbers do not have any uncertainty. In other words, they weren't measured!

1) Numbers that were determined by COUNTING!

How many blocks are to the left?

Exactly 4!

2) Numbers that arise from DEFINITIONS, often involving relationships between units

$$12 \text{ in} = 1 \text{ ft}$$

$$\text{km} = 10^3 \text{ m}$$

* All metric prefixes are exact!

- Treat exact numbers as if they have INFINITE significant figures!

35 Example

You'll need to round the answer to the right number of significant figures!

Convert 4.45 m to in, assuming that 2.54 cm = 1 in *

$$1 \text{ cm} = 10^{-2} \text{ m} \quad 2.54 \text{ cm} = 1 \text{ in}$$

$$\frac{4.45 \text{ m}}{10^{-2} \text{ m}} \times \frac{1 \text{ in}}{2.54 \text{ cm}} = 175.1968504 \text{ in}$$

(Note: In the original image, the units 'm' and 'cm' are crossed out in red. Green arrows point from the number 3 to the 4.45, and from the infinity symbol to both the 10⁻² and 2.54.)

Round the answer so that it has three SIGNIFICANT FIGURES, just like you do with any other multiplication/division using measurements!

$$= 175 \text{ in}$$

*An inch is defined as EXACTLY 2.54 cm !

When merely converting the units of a measurement, you almost always have the same number of significant figures in the answer as you did in the original measurement. (EXCEPTION: Temperature conversions, since they involve addition and subtraction)
