To predict whether a salt at a given concentration will precipitate out, calculate the reaction quotient Q and compare it to the Ksp

Example

$$A_{g}CI(s) \rightleftharpoons A_{g}^{\dagger}(c_{q}) + CI(a_{q})jK_{s}p^{2}l_{s}K_{s}p^$$

IF...

Q < Ksp ; the reaction proceeds to produce more products (dissolved ions), so more solid is able to dissolve: NO PRECIPITATION

Q > Ksp ; the reaction proceeds to produce more reactants (solid), so solid falls out of solution: PRECIPITATION OCCURS

 \checkmark Q = Ksp ; the reaction is at equilibrium. PRECIPITATION IS JUST BEGINNING

Would a solution with (Ag+) = 0.014 M and (Cl-) = 0.00042 M precipitate? $Q = \left(Ag^{+}\right) \left[(l^{-}\right) = (0.014)(0.00042) = 5.88 \times 10^{-6}$ $Q = 5.88 \times 10^{-6} > 1.8 \times 10^{-10}$ Since Q>Ksp, PRECIPITATION OCCURS! The "common ion effect" affects the solubility of a compound in solution. The presence of one of the ions in a salt in the solution will REDUCE THE SOLUBILITY of that salt!

$$Ag(I(s) \rightleftharpoons Ag^{\dagger}(u_{\eta}) + CI^{\dagger}(u_{\eta}))$$

Silver chloride is much less soluble in a solution of 0.1 M NaCl than it is in distilled water. Why? The presence of CHLORIDE ION forces the solubility equilibrium back to the left, meaning less silver chloride can dissolve!

Solubility can also be affected by pH - depending on the acidic or basic properties of the salt!

A second example: Salicylic acid in the characterization lab

Calculate the solubility of AgCI in distilled water. Then, calculate the solubility of AgCI in 0.10 M NaCl solution. Report both answers in parts per million (mg/L)

$$\begin{array}{l} A_{g}(I(s) \rightarrow A_{g}^{+}(u_{q}) + (I^{-}(u_{q}); hsp = 1.8 \times 10^{-10} \\ A_{g}^{+}(I(s) \rightarrow A_{g}^{+}(u_{q}) + (I^{-}(u_{q}); hsp = 1.8 \times 10^{-10} \\ A_{g}^{+}(I(s) \rightarrow A_{g}^{+}(u_{q}) + (I^{-}(u_{q}); hsp = 1.8 \times 10^{-10} \\ A_{g}^{+}(I(s) \rightarrow A_{g}^{+}(u_{q}) + (I^{-}(u_{q}); hsp = 1.8 \times 10^{-10} \\ A_{g}^{+}(I(s) \rightarrow A_{g}^{+}(u_{q}) + (I^{-}(u_{q}); hsp = 1.8 \times 10^{-10} \\ A_{g}^{+}(I(s) \rightarrow A_{g}^{+}(u_{q}) + (I^{-}(u_{q}); hsp = 1.8 \times 10^{-10} \\ A_{g}^{+}(I(s) \rightarrow A_{g}^{+}(u_{q}) + (I^{-}(u_{q}); hsp = 1.8 \times 10^{-10} \\ A_{g}^{+}(I(s) \rightarrow A_{g}^{+}(u_{q}) + (I^{-}(u_{q}); hsp = 1.8 \times 10^{-10} \\ A_{g}^{+}(I(s) \rightarrow A_{g}^{+}(u_{q}) + (I^{-}(u_{q}); hsp = 1.8 \times 10^{-10} \\ A_{g}^{+}(I(s) \rightarrow A_{g}^{+}(u_{q}) + (I^{-}(u_{q}); hsp = 1.8 \times 10^{-10} \\ A_{g}^{+}(I(s) \rightarrow A_{g}^{+}(u_{q}) + (I^{-}(u_{q}); hsp = 1.8 \times 10^{-10} \\ A_{g}^{+}(I(s) \rightarrow A_{g}^{+}(u_{q}) + (I^{-}(u_{q}); hsp = 1.8 \times 10^{-10} \\ A_{g}^{+}(I(s) \rightarrow A_{g}^{+}(u_{q}) + (I^{-}(u_{q}); hsp = 1.8 \times 10^{-10} \\ A_{g}^{+}(I(s) \rightarrow A_{g}^{+}(u_{q}) + (I^{-}(u_{q}); hsp = 1.8 \times 10^{-10} \\ A_{g}^{+}(I(s) \rightarrow A_{g}^{+}(u_{q}) + (I^{-}(u_{q}); hsp = 1.8 \times 10^{-10} \\ A_{g}^{+}(I(s) \rightarrow A_{g}^{+}(u_{q}) + (I^{-}(u_{q}); hsp = 1.8 \times 10^{-10} \\ A_{g}^{+}(I(s) \rightarrow A_{g}^{+}(u_{q}) + (I^{-}(u_{q}); hsp = 1.8 \times 10^{-10} \\ A_{g}^{+}(I(s) \rightarrow A_{g}^{+}(u_{q}) + (I^{-}(u_{q}); hsp = 1.8 \times 10^{-10} \\ A_{g}^{+}(I(s) \rightarrow A_{g}^{+}(u_{q}) + (I^{-}(u_{q}); hsp = 1.8 \times 10^{-10} \\ A_{g}^{+}(I(s) \rightarrow A_{g}^{+}(u_{q}) + (I^{-}(u_{q}); hsp = 1.8 \times 10^{-10} \\ A_{g}^{+}(I(s) \rightarrow A_{g}^{+}(u_{q}) + (I^{-}(u_{q}); hsp = 1.8 \times 10^{-10} \\ A_{g}^{+}(I(s) \rightarrow A_{g}^{+}(u_{q}) + (I^{-}(u_{q}); hsp = 1.8 \times 10^{-10} \\ A_{g}^{+}(I(s) \rightarrow A_{g}^{+}(u_{q}) + (I^{-}(u_{q}); hsp = 1.8 \times 10^{-10} \\ A_{g}^{+}(I(s) \rightarrow A_{g}^{+}(u_{q}) + (I^{-}(u_{q}); hsp = 1.8 \times 10^{-10} \\ A_{g}^{+}(I(s) \rightarrow A_{g}^{+}(u_{q}) + (I^{-}(u_{q}); hsp = 1.8 \times 10^{-10} \\ A_{g}^{+}(I(s) \rightarrow A_{g}^{+}(u_{q}) + (I^{-}(u_{q}); hsp = 1.8 \times 10^{-10} \\ A_{g}^{+}(I(s) \rightarrow A_{g}^{+}(u_{q}) + (I^{-}(u_{q}); hsp = 1.8 \times 10^{-10} \\ A_{g}^{+}(I(s) \rightarrow A_{g}^{+}(u_{q})) \\ A_{g}^{+$$

For distilled water:

 $\chi^2 = 1.8 \times 10^{-10}$ $\chi = 1.341640786 \times 10^{-5} M = [A_5^+] = [A_5^-] dissolved$

$$\frac{1.341640786 \times 10^{-5} \text{ mol} A_{5}Cl}{L} \times \frac{143.359 \text{ A}_{5}Cl}{\text{mol} A_{5}Cl} = 0.00199/L = 1.9 \text{ ppm}$$
AgCl, in distilled water

$$\begin{aligned} A_{3}(1 (s) \Rightarrow A_{3}^{+}(u_{4}) + (1^{-}(u_{4})) K_{5}p = 1.8 \times 10^{-10} \\ & [A_{3}^{+}](1) = 1.8 \times 10^{-10} \\ \\ For solubnility in 0.10 M NaCl: \\ Species [In,t] & \Delta [Eq.(1)] \\ \hline A_{3}^{+} & O + X \\ \hline (1^{-} & O.10 + X \\ (x) (0.10 + x) = 1.8 \times 10^{-10} \\ & We know that x < 0.10, so ... \\ O.10 & x = 1.8 \times 10^{-10} \\ & We know that x < 0.10, so ... \\ O.10 & x = 1.8 \times 10^{-10} \\ & x = 1.8 \times 10^{-9} M = [A_{3}^{+}] = [A_{3}(1)] J_{15}(1) ved \\ \hline \frac{1.8 \times 10^{-9} mul A_{5}(1)}{compare: L} \times \frac{143.35 \cdot 9.4 \cdot 6(1)}{mul A_{5}(1)} = 2.6 \times 10^{-7} g_{L} = \frac{2.6 \times 10^{-9} prm}{(0.00026)} \\ A_{3}Cl in 0.10 M NaCl \end{aligned}$$

Conclusion: The presence of a common ion greatly DECREASES solubiliy!

$$M_g(0H)_2(s) = M_g^2(a_g) + 20H^2(a_g)', k_{sp} = 1.8 \times 10^{-11}$$

This compound's solubility is pH dependent. How?

* In a BASIC solution, the concentration of hydroxide ion in solution is high. , so solubility is LOWER than in pure water.

* In an ACIDIC solution, we have a significant amount of hydronium, which can react with hydroxide. This lowers the hydroxide concentration and makes magnesium hydroxide MORE SOLUBLE

Generalizing

- If a compound is BASIC, then it will be LESS SOLUBLE in basic solutions, and MORE SOLUBLE in acidic solutions!
- If a compound is ACIDIC, then it will be MORE SOLUBLE in basic solutions, and LESS SOLUBLE in acidic solutions!
- If a compound is NEUTRAL (neither acidic nor basic), then its solubility will be UNAFFECTED by pH

²⁰³ COMPLEX IONS

- are ions that result from the reaction of a Lewis base (like water, ammonia, hydroxide ion, etc.) with a metal ion

- The Lewis base attaches to the metal ion by forming a COORDINATE COVALENT BOND with the metal ion.

$$A_{g}^{\dagger}(aq) + 2 : NH_{2}(aq) \longrightarrow H_{3}N - A_{g}^{\dagger} - NH_{3}(aq)$$

$$\left(A_{g}^{\dagger}(aq) + 2NH_{3}(aq) \longrightarrow A_{g}(NH_{3})_{2}^{\dagger}(aq)\right)$$

- The product of the reaction is called a "COMPLEX", and the attached Lewis bases are called "LIGANDS"

COMPLEX ION EQUILIBRIUM

- Described by the FORMATION CONSTANT, Kf

$$A^{+} + B \rightleftharpoons AB^{+}$$
$$K_{F} = \frac{[AB^{+}]}{[A^{+}][B]}$$

ex:
$$Ag^{+}+2NH_{3} \rightleftharpoons Ag(NH_{3})_{2}^{+}$$

 $K_{F} = \frac{[Ag(NH_{3})_{2}^{+}]}{[Ag^{+}][NH_{3}]^{2}} = \frac{1.7 \times 10^{7}}{1.7 \times 10^{7}}$

_What does this value for the equilibrium constant say about the favorability of the formation of the complex ion?

Since the formation of these complex ions is so favorable, we often assume that these reactions go to completion, and instead look at the small amount of complex ion that DISSOCIATES!

$$AB^{+} \stackrel{=}{=} A^{+} + B$$

$$K_{d} = [A^{+}][B] = \frac{1}{|K_{F}|}$$

$$K_{d} = \frac{1}{|K_{F}|}$$

$$K_{d} = \frac{1}{|K_{F}|}$$

Kd is called the DISSOCIATION CONSTANT, and it is equal to 1/Kf

$$e_X: A_g(NH_3)_2^+ \rightleftharpoons A_g^+ + 2NH_3$$

$$K_{a} = \frac{[A_{g}^{+}][NH_{3}]^{2}}{[A_{g}(NH_{3})_{2}^{+}]} = \frac{1}{1.7 \times 10^{7}} = 5.9 \times 10^{-8}$$

AMPHOTERIC COMPOUNDS

- All metal hydroxides react with ACIDS, but SOME metal hydroxides can react with BASES by forming a comlplex ion.

$$AI(0H)_{3}(4) + 3H_{3}0^{+} \rightleftharpoons AI^{3+}(uq) + 3H_{2}0(l)$$

... Aluminum hydroxide is soluble in acidic solutions.

$$A(04)_{3}(s) + OH(uq) = A(0H)_{4}(uq)$$

... And it is also soluble in bases due to the formation of this complex ion!

$$A1(0H)_{3}(s) \rightleftharpoons Al^{3}(aq) + 30H^{-}(aq); K_{sp} = 4.6 \times 10^{-33}$$

- So aluminum hydroxide is relatively insoluble in pure water, but its solubility increases greatly if the pH goes either up or down.

COMPLEX IONS AND SOLUBILITY

- What is the effect of complex formation on solubility?

$$A_{g}(l(s) \equiv A_{g}^{\dagger}(aq) + Cl^{-}(aq)$$

$$A_{g}^{\dagger}(aq) + 2NH_{3}(aq) \equiv A_{g}(NH_{3})_{2}^{\dagger}$$

What will the presence of ammonia do to the solubility of silver chloride?

Since the formation of the silver-ammonia complex is favorable, we expect that any dissolved silver ion would react with ammonia to make the complex.

This will REDUCE the concentration of free silver ion.

3 The reduction of free silver ion will cause more silver chloride to dissolve (Le Chateleir's principle - the equilibrium will try to produce more free silver ion to replace what the ammonia has removed)

So, the presence of a ligand which can form a complex with an ion from a salt will greatly INCREASE the solubility of that salt!
