You can combine all three steps on one line if you like!

$$
\begin{equation*}
25.0 \mathrm{~g} \mathrm{Br}_{2} \times \frac{1 \mathrm{~mol} \mathrm{Br}_{2}}{159.80 \mathrm{~g} \mathrm{r}_{2}} \times \frac{2 \mathrm{~mol} \mathrm{Al}}{3 \mathrm{~mol} \mathrm{Br}} \times \frac{26.98 \mathrm{~g} \mathrm{Al}}{1 \mathrm{~mol} \mathrm{Al}}=2.81 \mathrm{~g} \mathrm{Al} \tag{1}
\end{equation*}
$$

You can solve the second part of the question using CONSERVATION OF MASS - since there's only a single product and you already know the mass of all reactants.

$$
\begin{aligned}
& 25.0 \text { y } \mathrm{Br}_{2} \quad \text { But... } \\
& +2.81 \mathrm{~g} \text { Ar } \quad \begin{array}{l}
\text { But.... } \\
+ \text {...hat would you have done to calculate the mass of aluminum }
\end{array} \\
& \text { bromide IF you had NOT been asked to calculate the mass of } \\
& \text { aluminum FIRST? } \\
& 25.0 \mathrm{~g} \mathrm{Br}_{2} \times \frac{1 \text { mol } \mathrm{Br}_{2}}{159.80 \mathrm{Br}_{2}} \times \frac{2 \mathrm{~mol} \mathrm{AlBr}_{3}}{3 \mathrm{~mol} \mathrm{Br}} \times \frac{266.694 \mathrm{gAl} \mathrm{Br}_{3}}{1 \mathrm{~mol} \mathrm{Al} \mathrm{Br}_{3}}=27.8 \mathrm{~g}
\end{aligned}
$$

101 Example:
How many milliliters of 6.00 M hydrochloric acid is needed to completely react with 25.0 g of sodium carbonate?

$$
2 \mathrm{HCl}(\mathrm{aq})+\mathrm{Na}_{2} \mathrm{CO}_{3}(\mathrm{~s}) \longrightarrow \mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\left(\mathrm{O}_{2}(y)+2 \mathrm{NaC}\right)(\mathrm{aq})
$$

1 - Convert 25.0 grams sodium carbonate to moles. Use FORMULA WEIGHT.
2 - Convert moles sodium carbonate to moles HCl . Use CHEMICAL EQUATION.
3 - Convert moles HCl to volume HCl solution. Use MOLAR CONCENTRATION.

$$
\begin{gathered}
(1) \begin{array}{l}
\mathrm{Na}_{2} \mathrm{CO}_{3}: \mathrm{Na}_{9}: 2 \times 22.99 \\
\mathrm{C}: 1 \times 12.01 \\
0: \frac{3 \times 16.00}{105.99 \mathrm{ga}_{2} \mathrm{CO}_{3}=\mathrm{mol} \mathrm{Na}} \mathrm{Na}_{2} \mathrm{CO}_{3} \\
25.0 \text { y } \mathrm{Na}_{2} \mathrm{CO}_{3} \times \frac{\mathrm{mol} \mathrm{Na}}{2} \mathrm{CO}_{3} \\
105.99 \mathrm{gan}_{2} \mathrm{CO}_{3}
\end{array}=0.2358713086 \mathrm{mul} \mathrm{Na}_{2} \mathrm{CO}_{3}
\end{gathered}
$$

$$
\begin{aligned}
& \text { (2) } 2 \mathrm{~mol} \mathrm{HCl}=\operatorname{mol~} \mathrm{Na}_{2} \mathrm{CO}_{3} \\
& 0.2358713086 \mathrm{mul} \mathrm{Na} \mathrm{Na}_{3} \times \frac{2 \mathrm{~mol} \mathrm{HCl}}{\mathrm{~mol} \mathrm{Na}_{2} \mathrm{CO}_{3}}=0.4717426172 \mathrm{mul} \mathrm{HCl}
\end{aligned}
$$

${ }^{102}$ Example:
How many milliliters of 6.00 M hydrochloric acid is needed to completely react with 25.0 g of sodium carbonate?

$$
2 \mathrm{HCl}(\mathrm{aq})+\mathrm{Na}_{2} \mathrm{CO}_{3}(s) \longrightarrow \mathrm{H}_{2} \mathrm{O}(l)+\left(\mathrm{O}_{2}(y)+2 \mathrm{NaC}_{4}(\mathrm{aq})\right.
$$

1 - Convert 25.0 grams sodium carbonate to moles. Use FORMULA WEIGHT.
2 - Convert moles sodium carbonate to moles HCl . Use CHEMICAL EQUATION.
3 - Convert moles HCl to volume HCl solution. Use MOLAR CONCENTRATION.
(3) $6.00 \mathrm{~mol} \mathrm{HCl}=\mathrm{L}$

$$
0.4717426172 \mathrm{mul} \mathrm{HC} \left\lvert\, \times \frac{\mathrm{L}}{6.00 \mathrm{~mol} \mathrm{HCl}}=0.0786 \mathrm{~L}\right. \text { of } 6.00 \mathrm{~m} \mathrm{HCl}
$$

Notice the problem statement asks us for MILLILITERS and we have LITERS. No big problem here ... we just need to do a quick unit conversion.

$$
\begin{aligned}
& m L=10^{-3 L} \\
& 0.0786 L \times \frac{m L}{10^{-3 L}}=78.6 \mathrm{~mL} \text { of } 6.06 \mathrm{MHCl}
\end{aligned}
$$

25.0 mL of acetic acid solution requires 37.3 mL of 0.150 M sodium hydroxide for complete reaction. The equation for this reaction is:

$$
\mathrm{NaOH}+\mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2} \rightarrow \mathrm{NaC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}+\mathrm{H}_{2} \mathrm{O}
$$

What is the molar concentration of the acetic acid?

$$
\frac{1-\text { mol } \mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}}{\mathrm{~L} \text { Solution }}=25.0 \mathrm{~mL} \text { or } \mathrm{O}, 0250 \mathrm{~L}
$$

Since we already know the volume of the acetic acid solution, we just need to find out the moles acetic acid in order to get the concentration. How do we find THAT? Start with the 37.3 mL of sodium hydroxide. Since we know the concentration, we can relate that volume

$$
\begin{aligned}
& \text { to moves... } \\
& m L=10^{-3} L \quad 0.150 \mathrm{~mol} \mathrm{NaOH}=L \mid \mathrm{mol} \mathrm{NaOH}=\mathrm{mol} \mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2} \\
& 37.3 \mathrm{~mL} \times \frac{10^{-3} \mathrm{~L} \times \frac{0.150 \mathrm{~mol} \mathrm{NaOH}}{\mathrm{~mL}} \times \frac{\mathrm{mol} \mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}}{\mathrm{molNaOH}}=0.005595 \mathrm{~mol}}{\mathrm{HC}_{2} \mathrm{HzO}_{2}} \\
& N=\frac{\text { mol } \mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}}{\text { L Solution }}=\frac{0.005595 \mathrm{molhC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}}{0.0250-}=0.224 \mathrm{MHC} \mathrm{H}_{3} \mathrm{O}_{2}
\end{aligned}
$$

*Note for later: This is how the main calculation for EXPERIMENT 4C will be done!

104
$42.081 \mathrm{~g} / \mathrm{mol}$

$$
4 \mathrm{C}_{3}^{42.081} \mathrm{H}_{6}+6 \mathrm{~mol} \longrightarrow 4 \mathrm{CO}_{3}^{53.064} \mathrm{H}_{3}^{\mathrm{g} / \mathrm{Nal}}+6 \mathrm{H}_{2} \mathrm{O}+\mathrm{N}_{2}
$$

propylene
acrylonitrile
Calculate how many grams of acrylonitrile could be obtained from 651 kg of propylene, assuming there is excess NO present.

1 - Convert mass propylene to moles. Use FORMULA WEIGHT of propylene (and kg->g conversion)
2 - Convert moles propylene to moles acrylonitrile. Use CHEMICAL EQUATION
3 - Convert moles acrylonitrile to mass acrylonitrile. Use FORMULA WEIGHT of acrylonitrile.
$42.081 \mathrm{~g} \mathrm{C}_{3} \mathrm{H}_{6}=\mathrm{mol} \mathrm{C}_{3} \mathrm{H}_{6} \mid 4 \mathrm{mul} \mathrm{C}_{3} \mathrm{H}_{6}=4 \mathrm{~mol} \mathrm{C}_{3} \mathrm{H}_{3} \mathrm{~N}$
$53.064 \mathrm{~g} \mathrm{C}_{3} \mathrm{H}_{3} \mathrm{~N}=\mathrm{mol} \mathrm{C}_{3} \mathrm{H}_{3} \mathrm{~N} \mid \mathrm{Kg}_{\mathrm{g}}=10^{3} \mathrm{~g}$

$$
=821000 \mathrm{~g}_{3} \mathrm{H}_{3} \mathrm{~N}(821 \mathrm{~kg})
$$

105

$$
\begin{aligned}
& 1 \mathrm{SI} .90 \mathrm{~g} / \mathrm{mol} \\
& 10 \mathrm{FeSO}_{4}+2 \mathrm{KMnO}_{4}+8 \mathrm{H}_{2} \mathrm{SO}_{4} \rightarrow 5 \mathrm{Fe}_{2}\left(\mathrm{SO}_{4}\right)_{3}+2 \mathrm{MnSO}_{4}+\mathrm{K}_{2} \mathrm{SO}_{4} \\
&+8 \mathrm{H}_{2} \mathrm{O}
\end{aligned}
$$

How many mL of 0.250 M potassium permanganate are needed to react with 3.36 g of iron(II) sulfate?
1 - Convert 3.36 grams iron(Il) sulfate to moles. Use FORMULA WEIGHT.
2 - Convert moles iron(II) sulfate to moles potassium permangenate. Use CHEMICAL EQUATION.
3 - Convert moles potassium permangenate to volume. Use MOLAR CONCENTRATION.

$$
\begin{aligned}
& 1 \mathrm{Sl} .9 \mathrm{~g}_{\mathrm{geSO}}^{y} \mathrm{~F}=\mathrm{mul} \mathrm{FeSO}_{y} \quad 10 \mathrm{~mol} \mathrm{FeSO}_{y}=2 \mathrm{~mol} \mathrm{KMnO} \\
& 0.250 \mathrm{~mol} \mathrm{WMnO}=L \quad m L=10^{-3} \mathrm{~L}
\end{aligned}
$$

$$
\begin{align*}
& =17.7 \mathrm{~mL} \mathrm{of} 0.250 \mathrm{~m} \mathrm{KmnO}_{4} \tag{2}
\end{align*}
$$
