

A balloon is taken from a room where the temperature is 27.0 C to a freezer where the temperature is -5.0 C. If the balloon has a volume of 3.5 L in the 27.0 C room, what is the volume of the balloon in the freezer. Assume pressure is constant.

$$\frac{P_1 V_1}{T_1} = \frac{P_2 V_2}{T_2}, P_{\text{constant}} \dots \quad \frac{V_1}{T_1} = \frac{V_2}{T_2}$$

$$V_1 = 3.5 \text{ L} \quad \left| \quad V_2 = ?\right.$$

$$T_1 = 27.0^\circ\text{C} = 300.2 \text{ K} \quad \left| \quad T_2 = -5.0^\circ\text{C} = 268.2 \text{ K}\right.$$

$$\frac{(3.5 \text{ L})}{(300.2 \text{ K})} = \frac{V_2}{(268.2 \text{ K})}, \quad V_2 = \boxed{3.1 \text{ L in freezer}}$$

2.25 L of nitrogen gas is trapped in a piston at 25.0 C and 1.00 atm pressure. If the piston is pushed in so that the gas's volume is 1.00 L while the temperature increases to 31.0 C, what is the pressure of the gas in the piston?

$$\frac{P_1 V_1}{T_1} = \frac{P_2 V_2}{T_2} \quad \left. \begin{array}{l} P_1 = 1.00 \text{ atm} \\ V_1 = 2.25 \text{ L} \\ T_1 = 25.0^\circ\text{C} = 298.2 \text{ K} \end{array} \right| \begin{array}{l} P_2 = ? \\ V_2 = 1.00 \text{ L} \\ T_2 = 31.0^\circ\text{C} = 304.2 \text{ K} \end{array}$$

$$\frac{(1.00 \text{ atm})(2.25 \text{ L})}{(298.2 \text{ K})} = \frac{P_2 (1.00 \text{ L})}{(304.2 \text{ K})}; \quad P_2 = \boxed{2.30 \text{ atm}}$$

Calculate the mass of 22650^{*} L of oxygen gas at 25.0 C and 1.18 atm pressure.

*Volume of a 10'x10'x8' room

Use the ideal gas equation to find the MOLES of gas ...

$$PV = nRT$$

Find the moles of gas ... 'n' ... and then convert the moles of gas to mass using formula weight of oxygen gas.

$$n = \frac{PV}{RT}$$

$$P = 1.18 \text{ atm}$$

$$T = 25.0^\circ\text{C} = 298.2 \text{ K}$$

$$V = 22650 \text{ L}$$

$$R = 0.08206 \frac{\text{L}\cdot\text{atm}}{\text{mol}\cdot\text{K}}$$

$$n_{\text{O}_2} = \frac{(1.18 \text{ atm})(22650 \text{ L})}{(0.08206 \frac{\text{L}\cdot\text{atm}}{\text{mol}\cdot\text{K}})(298.2 \text{ K})} = 1092.222357 \text{ mol O}_2$$

$$1092.222357 \text{ mol O}_2 \times \frac{32.00 \text{ g O}_2}{\text{mol O}_2} = \boxed{35000 \text{ g O}_2} \begin{matrix} (35.0 \text{ kg}) \\ (\sim 77 \text{ lb}) \end{matrix}$$

$$FW_{\text{NaHCO}_3} = 84.007 \text{ g/mol}$$

Given 25.0 g of sodium bicarbonate and sufficient sulfuric acid, what volume of carbon dioxide gas would be produced at 25.0 C and 0.950 atm pressure?

- 1 - Convert 25.0 g sodium bicarbonate to moles using formula weight.
- 2 - Convert moles sodium bicarbonate to moles carbon dioxide using chemical equation
- 3 - Convert moles carbon dioxide to VOLUME using IDEAL GAS EQUATION

$$84.007 \text{ g NaHCO}_3 = 1 \text{ mol NaHCO}_3 \quad | \quad 2 \text{ mol NaHCO}_3 = 2 \text{ mol CO}_2$$

$$25.0 \text{ g NaHCO}_3 \times \frac{1 \text{ mol NaHCO}_3}{84.007 \text{ g NaHCO}_3} \times \frac{2 \text{ mol CO}_2}{2 \text{ mol NaHCO}_3} = 0.2975942481 \text{ mol CO}_2$$

$$PV = nRT \quad | \quad n = 0.2975942481 \text{ mol CO}_2 \quad P = 0.950 \text{ atm}$$

$$V = \frac{nRT}{P} \quad | \quad R = 0.08206 \frac{\text{L} \cdot \text{atm}}{\text{mol} \cdot \text{K}}$$

$$T = 25.0^\circ\text{C} = 298.2 \text{ K}$$

$$V = \frac{(0.2975942481 \text{ mol CO}_2)(0.08206 \frac{\text{L} \cdot \text{atm}}{\text{mol} \cdot \text{K}})(298.2 \text{ K})}{(0.950 \text{ atm})} = 7.6 \text{ L of CO}_2 \text{ at } 25.0^\circ\text{C}, 0.950 \text{ atm}$$

What volume would the gas in the last example problem have at STP?

STP: "Standard Temperature and Pressure" (0 C and 1 atm)

We can solve for the new volume with either the ideal gas equation or the combined gas law ...

$$PV = nRT, \quad V = \frac{nRT}{P} \quad \left| \quad \begin{array}{l} n = 0.2975942481 \text{ mol CO}_2 \quad P = 1 \text{ atm} \\ R = 0.08206 \frac{\text{L}\cdot\text{atm}}{\text{mol}\cdot\text{K}} \\ T = 0^\circ\text{C} = 273.15 \text{ K} \end{array} \right.$$

$$V = \frac{(0.2975942481 \text{ mol CO}_2)(0.08206 \frac{\text{L}\cdot\text{atm}}{\text{mol}\cdot\text{K}})(273.15 \text{ K})}{(1 \text{ atm})} = 6.67 \text{ L at STP}$$

Alternatively, we could use the combined gas law:

$$\frac{P_1 V_1}{T_1} = \frac{P_2 V_2}{T_2} \quad \left| \quad \begin{array}{ll} P_1 = 0.950 \text{ atm} & P_2 = 1 \text{ atm} \\ V_1 = 7.67 \text{ L} & V_2 = ? \\ T_1 = 298.2 \text{ K} & T_2 = 273.15 \text{ K} \end{array} \right.$$

$$\frac{(0.950 \text{ atm})(7.67 \text{ L})}{(298.2 \text{ K})} = \frac{(1 \text{ atm})V_2}{(273.15 \text{ K})}; \quad V_2 = 6.67 \text{ L at STP}$$
