Example: How would we prepare 500. mL of 0.500 M sodium sulfate in water?

 $V_{a_2} S_{a_4}$: 142.05 g/mol Dissolve the appropriate amount of sodium sulfate into enough water to make 500. mL of solution.

 H_2O

volumetric flask

Given that we need 0.500 M sodium sulfate (concentration) and we need 500 mL (volume), we can calculate the MOLES OF SODIUM SULFATE REQUIRED. Then, convert the moles sodium sulfate to MASS using the formula weight.

0.500 mol Nar Soy =
$$mL = 10^{-3}L$$
 142.05 g Nar Soy = mol Nar Soy
SOO. mK x $\frac{10^{-3}K}{mK}$ x $\frac{0.500 \text{ mol Nar Soy x}}{M}$ $\frac{142.05 \text{ g Nar Soy}}{m01 Nar Soy}$ - 35.5 g
To mole the solution which out 25.5 grams and immediate multiple a

To make the solution, weigh out 35.5 grams sodium sulfate, put into a 500 mL volumetric flask, and add water to the mark.

More on MOLARITY

To prepare a solution of a given molarity, you generally have two options:

Weigh out the appropriate amount of solute, then dilute to the desired volume with solvent (usually water)

/---"stock solution"

Take a previously prepared solution of known concentration and DILUTE it with solvent to form a new solution

- Use DILUTION EQUATION

The dilution equation is easy to derive with simple algebra.

... but when you dilute a solution, the number of moles of solute REMAINS CONSTANT. (After all, you're adding only SOLVENT)

$$M_1 V_1 = M_2 V_2$$

before after Since the number of moles of solute stays the same, this equality must be true!

before diution after dilution

$$\begin{split} & M_1 \bigvee_1 = M_2 \bigvee_2 \quad \text{... the "DILUTION EQUATION"} \\ & M_1 \doteq \text{molarity of concentrated solution} \\ & \bigvee_1 \doteq \text{volume of concentrated solution} \\ & M_2 \doteq \text{molarity of dilute solution} \\ & \bigvee_2 \equiv \text{volume of dilute solution} \left(\text{fatal values} not \text{volume af} \\ & \text{added solven r.'} \right) \\ & \text{The volumes don't HAVE to be in liters, as long as you use the same volume UNIT for both volumes!} \\ & \text{Example: Take the 0.500 M sodium sulfate we discussed in the previous example and dilute it to make 150. mL of 0.333 M solution. How many mL of the original solution will we need to dilute? \\ & M_1 \bigvee_1 = M_2 \bigvee_2 \qquad M_1 \equiv 0.500 \text{ M} \quad M_2 \equiv 0.333 \text{ M} \\ & \bigvee_1 \equiv 2 \quad \bigvee_2 \equiv 1 \text{ Som } M_1 \\ & (0.500 \text{ M}) \bigvee_1 \equiv (0.333 \text{ M}) (150 \text{ mL}) \\ & \bigvee_1 \equiv 99.9 \text{ mL of } 0.500 \text{ Mar Say} \end{split}$$

To prepare the solution, take 99.9 mL of the 0.500 M sodium sulfate, then add enough water to make 150. mL of solution.

- Chemical reactions proceed on an ATOMIC basis, NOT a mass basis!

- To calculate with chemical reactions (i.e. use chemical equations), we need everything in terms of ATOMS ... which means MOLES of atoms

- To do chemical calculations, we need to:

- Relate the amount of substance we know (mass or volume) to a number of moles

- Relate the moles of one substance to the moles of another using the equation
- Convert the moles of the new substance to mass or volume as desired

$$2 A(ls) + 3 Br_2(l) \longrightarrow 2 A(Br_3(s))$$

* Given that we have 25.0 g of liquid bromine, how many grams of aluminum would we need to react away all of the bromine?

) Convert grams of bromine to moles: Need formula weight B_{r_2} : $\frac{2 \times 74,96}{159.80}$ 159.80 g B_{r_2} : mol B_{r_2} $25,0g B_{r_2} \times \frac{mol B_{r_2}}{159.80} = 0.15645$ mol B_{r_2}

Use the chemical equation to relate moles of bromine to moles of aluminum $2 \mod A = 3 \mod B c_2$ $0.15645 \mod B c_2 \times \frac{2 \mod A }{3 \mod B c_2} = 0.10430 \mod A$

3 Convert moles aluminum to mass: Need formula weight A| = 26.98 26.98 A| = mol A|0.10430 mol $A| \times \frac{26.98}{mol A|} = 2.81$ A|

You can combine all three steps on one line if you like! $159.80_{g}B_{f_2} = mol B_{f_2}$ (2) $2mol A_{1} = 3mol B_{f_2}$ (3) $26.98_{g}A_{1} = mol A_{1}$

$$25.0g Br_{2} \times \frac{mol Br_{2}}{159.80g Br_{2}} \times \frac{2mol Al}{3mol Br_{2}} \times \frac{26.98g Al}{mol Al} = 2.81 g Al$$

$$(1) \qquad (2) \qquad (3)$$

Things we can do:

If we have	and we need	Use
MASS	MOLES	FORMULA WEIGHT
SOLUTION VOLUME	MOLES	MOLAR CONCETRATION (MOLARITY)
MOLES OF A	MOLES OF B	BALANCED CHEMICAL EQUATION
