CHEMICAL CALCULATIONS CONTINUED: REACTIONS

- Chemical reactions proceed on an ATOMIC basis, NOT a mass basis!
- To calculate with chemical reactions (i.e. use chemical equations), we need everything in terms of ATOMS ... which means MOLES of atoms

$$
2 A\left|(s)+3 B r_{2}(l) \longrightarrow 2 A\right| B r_{3}(s)
$$

coefficients are in terms of atoms and molecules!

$$
\frac{2 \text { atoms } A \mid}{}=3 \text { molecules } B_{r_{2}}=2 \text { formulaunits } A \mid B_{r_{3}}
$$

- To do chemical calculations, we need to:
- Relate the amount of substance we know (mass or volume) to a number of moles
- Relate the moles of one substance to the moles of another using the equation
- Convert the moles of the new substance to mass or volume as desired

$$
2 \mathrm{~A}\left|(\mathrm{~s})+3 \mathrm{Br}_{2}(l) \longrightarrow 2 \mathrm{~A}\right| B r_{3}(s)
$$

* Given that we have 25.0 g of liquid bromine, how many grams of aluminum would we need to react away all of the bromine?
(1) Convert grams of bromine to moles: Need formula weight

$$
\begin{gathered}
159.80 \mathrm{~g} \mathrm{Br} \\
25.0 \mathrm{~mol} \mathrm{Br}_{2} \\
2 \mathrm{Br}_{2} \times \frac{\mathrm{mol} \mathrm{Br}_{2}}{159.80 \mathrm{~g} \mathrm{gr}_{2}}=0.15645 \mathrm{~mol} \mathrm{Br}_{2}
\end{gathered}
$$

(2) Use the chemical equation to relate moles of bromine to moles of aluminum

$$
\begin{aligned}
2 \mathrm{~mol} A 1 & =3 \mathrm{~mol} B r_{2} \\
0.1564 \mathrm{smol} B r_{2} & \times \frac{2 \mathrm{~mol} A 1}{3 \mathrm{~mol} B r_{2}}
\end{aligned}=0.10430 \mathrm{~mol} \mathrm{Al}
$$

(3) Convert moles aluminum to mass: Need formula weight $\mathrm{Al}: 26.98$

$$
\begin{aligned}
& 26.98 \mathrm{gAl}=\operatorname{mol} A 1 \\
& 0.10430 \mathrm{~mol} A 1 \times \frac{26.98 \mathrm{~g} A 1}{\operatorname{mol} A 1}=2.81 \mathrm{~g} \mathrm{Al}
\end{aligned}
$$

You can combine all three steps on one line if you like!
(1) $159.80 \mathrm{~g}_{2}=\mathrm{mol} \mathrm{Br}_{2}$
(2) 2 mol $A l=3$ mol $B r_{2}$
(3) $26,98 \mathrm{gAl}=\mathrm{mol} \mathrm{Al}$

$$
\begin{gathered}
25.0 \mathrm{gBr} \times \frac{\mathrm{mol} \mathrm{Br}_{2}}{159.80 \mathrm{gr}_{2}} \times \frac{2 \mathrm{~mol} \mathrm{Al}}{3 \mathrm{~mol} \mathrm{Br}_{2}} \times \frac{26.98 \mathrm{~g} \mathrm{Al}}{\mathrm{~mol} \mathrm{Al}}=2.81 \mathrm{~g} \mathrm{Al} \\
(1)
\end{gathered}
$$

## CONCEPT OF LIMITING REACTANT

- When does a chemical reaction STOP?

$$
\begin{aligned}
& \left.2 \mathrm{Mg}_{\mathrm{g}}(\mathrm{~s})+\mathrm{O}_{2}(\mathrm{~g}) \xrightarrow{\Delta}>2 \mathrm{mgO}_{\mathrm{m}} \mathrm{~s}\right) \\
& \text { Magnesium }
\end{aligned}
$$

- When does this reaction stop? When burned in open air, this reaction stops when all the MAGNESIUM STRIP is gone. We say that the magnesium is LIMITING.
- This reaction is controlled by the amount of available magnesium
- At the end of a chemical reaction, the LIMITING REACTANT will be completely consumed but there may be amount of OTHER reactants remaining. We do chemical calculations in part to minimize these "leftovers".

$$
\begin{aligned}
& \text { These are often called "excess" reactants, or reactants present } \\
& \text { "in excess" }
\end{aligned}
$$
