$2 \operatorname{NH}_{4} \operatorname{NO}_{3}(s) \longrightarrow 2 \operatorname{N}_{2}(g) + O_{2}(g) + 4 \operatorname{H}_{2}O(g)$

At 300, C, ammonium nitrate violently decomposes to produce nitrogen gas, oxygen gas, and water vapor. What is the total volume of gas that would be produced at 1.00 atm by the decomposition of 15.0 grams of ammonium nitrate?

To simplify the calculation, we will calculate the TOTAL MOLES OF GAS instead of treating the different gas molecules separately!

1 - Convert 15.0 grams ammonium nitrate to moles. Use FORMULA WEIGHT.

2 - Convert moles ammonium nitrate to TOTAL MOLES OF GAS. Use CHEMICAL EQUATION

3 - Convert TOTAL MOLES GAS to volume. Use IDEAL GAS EQUATION.

$$\begin{bmatrix} 80.052 g \, NH_4 \, NO_2 = mol \, NH_4 \, NO_2 \\ 0 \\ 15.0 g \, NH_4 \, NO_2 \chi \\ \frac{mol \, NH_4 \, NO_2}{80.052 g \, NH_4 \, NO_2} \chi \\ \frac{7mol \, gas}{2 \, mol \, NH_4 \, NO_2} = 0.6558237146 \, mol \, gas$$

$$\frac{3}{V} = nRT | n=0.6558237146 \text{ mol} gas P=1.00 \text{ atm} \\ V = nRT | R=0.08206 \frac{L-atm}{mul.kr} \\ P | T=300.°C = 573 \text{ K} \\ V = (0.6558237146 \text{ mol} gas)(0.08206 \frac{L-atm}{mul.kr})(573 \text{ K}) = 30.8L \\ (1.00 \text{ atm}) \\ \end{bmatrix}$$

 \mathbf{O}

~ ~

REAL GASES

- The empirical gas laws (including the ideal gas equation) do not always apply.

- The gas laws don't apply in situations where the assumptions made by kinetic theory are not valid.

- When would it be FALSE that the space between gas molecules is much larger than the molecules themselves?

- at high pressure, molecules would be much closer together!

- When would it be FALSE that attractive and repulsive forces would be negligible?

- at high pressure, attractions and repulsions should be stronger!

- at low temperature, attractions and repulsions have a more significant affect on the paths of molecules

-The gas laws are highly inaccurate near the point where a gas changes to liquid!

- In general, the lower the pressure and the higher the temperature, the more IDEAL a gas behaves.

van der Waals equation

- an attempt to modify PV = nRT to account for several facts.

- gas molecules actually have SIZE (they take up space)
- attractive and repulsive forces

$$PV = n R T \int \text{Ideal gas equation}$$

$$\left(P + \frac{n^{2} \alpha}{V^{2}}\right) \left(V - nb\right) = n R T \int \text{van der Waals}_{equation}$$

2500 L of chlorine gas at 25.0 C and 1.00 atm are used to make hydrochloric acid. How many kilograms of hydrochloric acid could be produced if all the chlorine reacts?

$$-1_2 + C|_2 \rightarrow 2HC$$

1 - Convert 2500L of chlorine gas to moles. Use IDEAL GAS EQUATION.

2 - Convert moles chlorine gas to moles HCI. Use CHEMICAL EQUATION.

3 - Convert moles HCI to mass. Use FORMULA WEIGHT.

(1)
$$PV = nRT$$
 | $P = 1.00 \text{ atm} V = 2500L$ $R = 0.08206 L \cdot atm}{mol.k}$
 $N = \frac{PU}{RT}$ | $T = 25.0 \circ C = 298.2 \text{ k}$
 $N_{C12} = \frac{(1.00 \text{ atm})(2500L)}{(0.08206 L \cdot atm)(298.2 \text{ k})} = 102.1646983 \text{ mol} Cl_2$
(2) mol $C12 = 2 \text{ mol} HCI$ (3) $HCI = H: 1\times1.00\%$
 $C1: 1\times35.45$
 $36.458gHCI = mol HCI$
 $Rg = 10\frac{2}{5}$
 $102.1646983 \text{ mol} Cl_2 \times \frac{2 \text{ mol} HCI}{mol} \times \frac{36.458gHCI}{MOl} = 7.45 \text{ kg} HCI$
 $Rg = 7.45 \text{ kg} HCI$
 $Rg = 10\frac{2}{5}$
 $Rg = 10\frac{2}{$

$$2HCI + Na_2CO_3 \rightarrow CO_2 + H_2O + 2NaCI$$

If 48.90 mL of 0.250 M HCI solution reacts with sodium carbonate to produce 50.0 mL of carbon dioxide gas at 290.2 K, what is the pressure of the carbon dioxide gas?

1 - Convert 48.90 mL of HCI solution to moles. Use MOLARITY.

2 - Convert moles HCI to moles carbon dioxide gas. Use CHEMICAL EQUATION.

3 - Convert moles carbon dioxide gas to pressure. Use IDEAL GAS EQUATION.

$$\begin{array}{c} 1 \ 0.250 \text{ mol} \ HCl = L, \ mL = 10^{-3} L \end{array} \begin{array}{c} 2 \ 2 \ mol \ HCl = mol \ Co_{2} \end{array} \\ \hline 1 \ 0.250 \text{ mol} \ HCl = 10^{-3} L \end{array} \begin{array}{c} 2 \ 2 \ mol \ HCl = mol \ Co_{2} \end{array} \\ \hline 1 \ 48.90 \text{ mL} \ x \ \frac{10^{-3} L}{mL} x \ \frac{0.250 \text{ mol} \ HCl}{x \ 2 \ mol \ HCl} \end{array} \\ \hline x \ \frac{mol \ Co_{2}}{2 \ mol \ HCl} = 0.006 (125 \ mol \ Co_{2} \end{array} \\ \hline \begin{array}{c} 3 \ PV = n \ RT \\ P = n \ RT \\ V = 50.0 \text{ mL} \ x \ \frac{10^{-3} L}{mL} = 0.0500 L \end{array} \\ \hline Y = 50.0 \text{ mL} \ x \ \frac{10^{-3} L}{mL} = 0.0500 L \end{array} \\ \hline P = \frac{(0.006 (125 \ mol \ Co_{2}) \left(0.08206 \frac{L \ calm}{mol \ Hcl}\right) \left(290.2 \ H)}{mL} = 2.91 \ a \ tm \end{array}$$
