REDOX LANGUAGE

"oxidizer"

- "Oxidation" is loss of electrons, but an OXIDIZING AGENT is something that causes ANOTHER substance to lose electrons. An oxidizing agent is itself reduced during a redox reaction.
- "Reduction" is gain of electrons, but a REDUCING AGENT is something that causes ANOTHER substace to gain electrons. Reducing agents are themselves oxidized during a redox reaction.

$$2 \xrightarrow{A} (s) + 3 \xrightarrow{B} (l) \longrightarrow 2 \xrightarrow{A} (3 + 3 - 1)$$

Aluminum is OXIDIZED during this process. We say that metallic aluminum is a REDUCING AGENT!

Bromine is REDUCED during this process. We say that bromine is an OXIDIZING AGENT!

- * Strong oxidizers (oxidizing agents) can cause spontaneous fires if placed into contact with combustibles (safety issue!).
 - * Reactive metals tend to be REDUCING AGENTS, while oxygen-rich ions like NITRATES tend to be OXIDIZING AGENTS. HALOGENS (Group VIIA) also tend to be OXIDIZING AGENTS

END OF CHAPTER 4 MATERIAL

- Gases differ from the other two phases of matter in many ways:
 - They have very low viscosity (resistance to flow), so they flow from one place to another very easily.
 - They will take the volume of their container. In other words, gas volumes are variable.
 - They are the least dense of all three phases.
 - Most gases are transparent, and many are invisible. thermal expansion!
 - Gases show a much larger change of volume on heating or cooling than the other phases.
 - Gases react to changes in temperature and pressure in a very similar way. This reaction often does not depend on what the gas is actually made of.

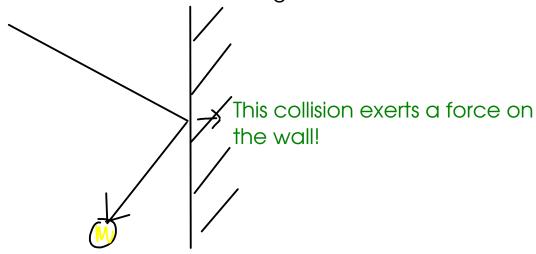

KINETIC THEORY

- is a way to explain the behavior of gases.
- views the properties of gases as arising from them being molecules in motion.

- Pressure: force per unit area. Units: Pascal, bar, mm Hg, in Hg, atm, etc.

- According to kinetic theory, pressure is caused by collisions of gas molecules with each other and the walls of the container the gas is in.

¹³⁵- Temperature:

- a measure of the average kinetic energy of the molecules of the gas

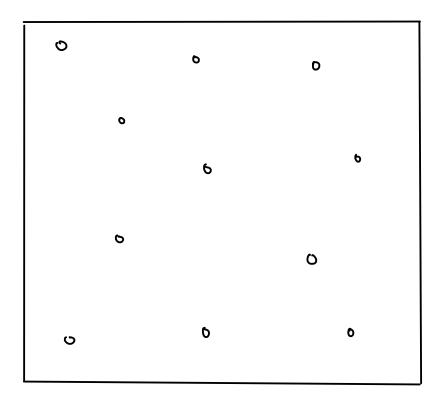

$$\frac{1}{2} \frac{m}{2} \frac{v^2}{\text{velocity}}$$
mass

- The faster the gas molecules move, the higher the temperature!
- The temperature scales used when working with gases are ABSOLUTE scales.
 - ABSOLUTE: scales which have no values less than zero.

- KELVIN: metric absolute temperature scale.

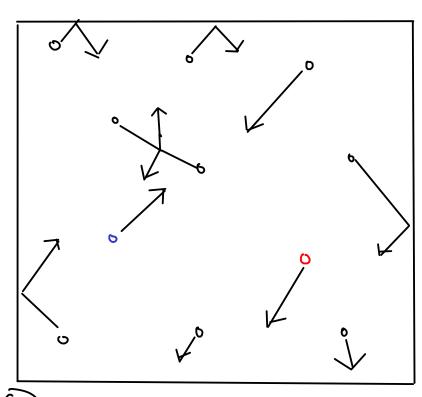

Quick comparison of temperature scales!			K=273.15+°C	
	212	100	373	Water boils
\rightarrow	$\gamma\gamma$	25	298	Room temperature
	32	O	273	Water freezes
	-460	-273	0	Absolute zero!
	OF	0	K	

THE KINETIC PICTURE OF GASES

Gas molecules are small compared to the space between the gas molecules!

LOW DENSITY!

- Gas molecules are constantly in motion. They move in straight lines in random directions and with various speeds.
- Attractive and repulsive forces between gas molecules are so small that they can be neglected except in a collision.
 - Each gas molecule behaves independently of the others.
- Collisions between gas molecules and each other or the walls are ELASTIC.
- (S) The average kinetic energy of gas molecules is proportional to the absolute temperature.

How does this picture explain the properties of gases?

- Gases expanding to fill their container? Agrees with kinetic picture, since gas molecules are independent
- Thermal expansion of gas at constant pressure? Agrees, because the container has to EXPAND to keep the pressure (from collisions) constant when the gas molecules move faster.
- Pressure increases with temperature at constant volume: Agrees, because the number and force of collisions increases with molecular speed.

GAS LAWS

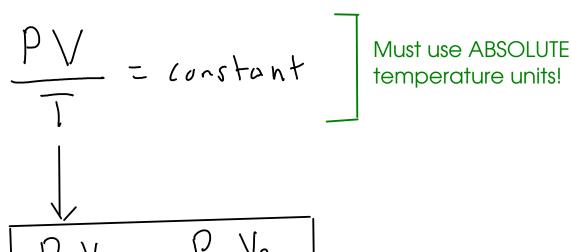

- were derived by experiment long before kinetic theory, but agree with the kinetic picture!

Boyle's Law:

$$P_1V_1 = constant$$
 $P_2V_2 = constant$
 $P_1V_1 = P_2V_2$
True at constant temperature

Charles's Law:

Must use ABSOLUTE temperature units!

Avogadro's law:

constant,

- a mole of any gas at the same conditions has the same volume.
