

Ideal gas law:

$$\frac{PV}{T} = \text{constant}$$

... but this constant actually depends on the amount of gas!

$$= n \times "R"$$

The ideal gas constant,

$$0.08206 \frac{\text{L} \cdot \text{atm}}{\text{mol} \cdot \text{K}}$$

... combining these together ...

$$\frac{PV}{T} = nR$$

$$PV = nRT$$

P = pressure atm

V = volume L

T = ABSOLUTE temperature K

R = ideal gas constant

n = number of moles of gas molecules

A balloon is taken from a room where the temperature is 27.0 C to a freezer where the temperature is -5.0 C. If the balloon has a volume of 3.5 L in the 27.0 C room, what is the volume of the balloon in the freezer. Assume pressure is constant.

$$\frac{P_1 V_1}{T_1} = \frac{P_2 V_2}{T_2} \xrightarrow[\text{constant } P]{\text{constant}} \frac{V_1}{T_1} = \frac{V_2}{T_2}$$

$$\begin{aligned} V_1 &= 3.5 \text{ L} & V_2 &= ? \\ T_1 &= 27.0^\circ\text{C} & T_2 &= -5.0^\circ\text{C} \\ &= 300.2 \text{ K} & &= 268.2 \text{ K} \end{aligned}$$

$$\frac{3.5 \text{ L}}{300.2 \text{ K}} = \frac{V_2}{268.2 \text{ K}}$$

$$\boxed{3.1 \text{ L} = V_2}$$

2.25 L of nitrogen gas is trapped in a piston at 25.0 C and 1.00 atm pressure. If the piston is pushed in so that the gas's volume is 1.00 L while the temperature increases to 31.0 C, what is the pressure of the gas in the piston?

$$\frac{P_1 V_1}{T_1} = \frac{P_2 V_2}{T_2}$$

$$\begin{aligned} P_1 &= 1.00 \text{ atm} & P_2 &= ? \\ V_1 &= 2.25 \text{ L} & V_2 &= 1.00 \text{ L} \\ T_1 &= 25.0^\circ\text{C} & T_2 &= 31.0^\circ\text{C} \\ &= 298.2 \text{ K} & &= 304.2 \text{ K} \end{aligned}$$

$$\frac{(1.00 \text{ atm})(2.25 \text{ L})}{(298.2 \text{ K})} = \frac{P_2 (1.00 \text{ L})}{(304.2 \text{ K})}$$

$$\boxed{2.30 \text{ atm} = P_2}$$

Calculate the mass of 22650 L<sup>\*</sup> of oxygen gas at 25.0 C and 1.18 atm pressure.

\*Volume of a 10'x10'x8' room

- 1 - Calculate the moles of gas in the room using IDEAL GAS EQUATION.
- 2 - Convert moles gas (assuming it's all oxygen) to mass using FORMULA WEIGHT.

$$PV = nRT$$

Find the moles of gas by solving for 'n' ...

$$\frac{PV}{RT} = n \quad \left| \quad \begin{array}{l} P = 1.18 \text{ atm} \quad R = 0.08206 \frac{\text{L} \cdot \text{atm}}{\text{mol} \cdot \text{K}} \\ V = 22650 \text{ L} \quad T = 25.0^\circ\text{C} = 298.2 \text{ K} \end{array} \right.$$

$$\textcircled{1} n_{\text{O}_2} = \frac{(1.18 \text{ atm})(22650 \text{ L})}{(0.08206 \frac{\text{L} \cdot \text{atm}}{\text{mol} \cdot \text{K}})(298.2 \text{ K})} = 1092.222357 \text{ mol O}_2$$

$$\textcircled{2} 32.00 \text{ g O}_2 = \text{mol O}_2$$

$$1092.222357 \text{ mol O}_2 \times \frac{32.00 \text{ g O}_2}{\text{mol O}_2} = \boxed{35000 \text{ g O}_2} \quad \begin{array}{l} 35000 \text{ Kg} \\ \sim 77 \text{ lb} \end{array}$$

$$FW_{\text{NaHCO}_3} = 84.007 \text{ g/mol}$$

Given 25.0 g of sodium bicarbonate and sufficient sulfuric acid, what volume of carbon dioxide gas would be produced at 25.0 C and 0.950 atm pressure?

- 1 - Convert 25.g sodium bicarbonate to moles. Use FORMULA WEIGHT.
- 2 - Convert moles sodium bicarbonate to moles carbon dioxide. Use CHEMICAL EQUATION.
- 3 - Convert moles carbon dioxide to volume. Use IDEAL GAS EQUATION.

$$\textcircled{1} 84.007 \text{ g NaHCO}_3 = 1 \text{ mol NaHCO}_3 \quad \textcircled{2} 2 \text{ mol NaHCO}_3 = 2 \text{ mol CO}_2$$

$$25.0 \text{ g NaHCO}_3 \times \frac{1 \text{ mol NaHCO}_3}{84.007 \text{ g NaHCO}_3} \times \frac{2 \text{ mol CO}_2}{2 \text{ mol NaHCO}_3} = 0.2975942481 \text{ mol CO}_2$$

$$\begin{array}{l|l} PV = nRT & n = 0.2975942481 \text{ mol CO}_2 \quad T = 25.0^\circ\text{C} = 298.2 \text{ K} \\ V = \frac{nRT}{P} & R = 0.08206 \frac{\text{L}\cdot\text{atm}}{\text{mol}\cdot\text{K}} \quad P = 0.950 \text{ atm} \end{array}$$

$$V = \frac{(0.2975942481 \text{ mol CO}_2)(0.08206 \frac{\text{L}\cdot\text{atm}}{\text{mol}\cdot\text{K}})(298.2 \text{ K})}{(0.950 \text{ atm})} = 7.67 \text{ L CO}_2$$

at 25.0°C,  
0.950 atm

What volume would the gas in the last example problem have at STP?

STP: "Standard Temperature and Pressure" (0 C and 1 atm)

Let's use the combined gas law to get the volume at STP:

$$\frac{P_1 V_1}{T_1} = \frac{P_2 V_2}{T_2}$$

$$P_1 = 0.950 \text{ atm} \quad P_2 = 1.00 \text{ atm}$$

$$V_1 = 7.67 \text{ L} \quad V_2 = ?$$

$$T_1 = 298.2 \text{ K} \quad T_2 = 273.2 \text{ K}$$

$$\frac{(0.950 \text{ atm})(7.67 \text{ L})}{(298.2 \text{ K})} = \frac{(1.00 \text{ atm}) V_2}{(273.2 \text{ K})}$$

$$6.67 \text{ L} = V_2$$

$$6.67 \text{ L CO}_2 \text{ at STP}$$

Note: STP is a \*defined\* condition ... so the 1 atm and 0 C temperatures are EXACT.

Alternate solution: Use  $PV=nRT$  a second time with STP as the temperature and pressure (since we already calculated moles in the previous problem.)
