## MOLECULAR COMPOUNDS

- There are several kinds of molecular compound. We will learn to name two simple but important classes

# BINARY MOLECULAR COMPOUNDS

- molecular compounds containing only two elements

- molecular compounds that dissolve in water to release  $H^{-1}$  ions
- corrosive to metals (react with many to produce hydrogen gas)
- contact hazard: can cause chemical burns to eyes and skin
- sour taste
- turn litmus indicator RED
- two kinds of acids:

() <u>BINARY ACIDS</u>

Usually from Group VIIA

- contain hydrogen and one other element

OXYACIDS

- contain hydrogen, OXYGEN, and another element

#### **BINARY MOLECULAR COMPOUNDS**

- Named based on the elements they contain, plus prefixes to indicate the number of atoms of each element in each molecule

FIRST ELEMENT

- Add a GREEK PREFIX to the name of the element.
- Omit the "MONO-" (1) prefix if there is only one atom of the first element

こ/ <u>SECOND ELEMENT</u>

- Add a <u>GREEK PREFIX</u> to the STEM NAME of the element
- Add the suffix "-ide" (as if you were naming an anion)
- DO NOT omit the "mono-" prefix if there is only one atom of the second element

SEE COURSE WEB SITE FOR A LIST OF GREEK PREFIXES! THESE ARE THE SAME PREFIXES USED FOR THE HYDRATES!

#### BINARY MOLECULAR COMPOUNDS

BF3	$(1_2 0_7)$	CO	$CO_2$
boron	dichlorine	carbon	carbon
trifluoride	heptaoxide	monoxide	dioxide

\*Note: metalloids like boron behave chemically like nonmetals do.

carbon tetrachloride

dihydrogen monoxide  $H_2 \bigcirc$ 

dinitrogen tetrafluoride

Evapoloa

) BINARY ACIDS

- named after the element (other than hydrogen) they contain
- common binary acids include a Group VIIA element
- named: "Hydro-" + STEM NAME OF ELEMENT+ "-ic acid"

Four common binary acids HF: hydrofluoric acid\* dissolves glass!

HCL · hydrochloric acid \* most common binary acid!

HBr: hydrobromic acid

HI: hydroiodic acid

#### ACIDS

(i) OXYACIDS

75

- Easy to think about as HYDROGEN IONS combined with POLYATOMIC IONS

- These acids are not true ionic compounds, but they interact with water to PRODUCE ions!

- named based on the polyatomic ion they contain, with an ending change:

1) - ions ending in -ATE form acids ending in -IC

 $\mathfrak{L}$ - ions ending in -ITE form acids ending in -OUS

sulfATE	phosphATE	sulfITE	nitrate
H2 SO4	HzPOy	$H_2SO_3$	HNO3
sulfuric acid	phosphoric acid	sulfurous acid	nitric acid

#### **OXYACID EXAMPLES**

aceti<u>c</u> acid based on ACETATE

 $H^{+}(_{2}H_{3}O_{2}^{-})$ 

HC2H2O2

nitrous acid based on NITRITE  $f( + NO_{2} -$ 

HNO,

# carbonic acid based on CARBONATE $H^{+} CO_{3}^{2-}$ $H^{+} H^{+} CO_{3}^{2-}$

The number of hydrogen atoms at the beginning of the formula equals the charge of the anion the acid is based on! - You need to be able to tell, by looking at a name OR a formula, what kind of compound you are working with!

DON'T GET THE NAMING SYSTEMS MIXED UP! EACH KIND OF COMPOUND IS NAMED WITH ITS OWN SYSTEM!

### FROM A CHEMICAL NAME

- If the name has a Roman numeral, the name of a metal, or "ammonium", the compound is likely IONIC

- If the name has a Greek prefix AND the prefix is NOT in front of the word "hydrate", the compound is <u>BINARY MOLECULAR</u>

- If the name contains the word "acid":

... and starts with "hydro-", then the compound is a BINARY ACID

... and does not start with "hydro-", the compound is an OXYACID

FROM A CHEMICAL FORMULA

- if the formula contains a metal or the NH  $\frac{+}{4}$  ion, it is likely I<u>ONIC</u>

 $H_2O$   $H_2O_2$ - If the formula starts with H and is not either water or hydrogen peroxide, the compound is likely an ACID. Which kind?

- BINARY ACIDS contain only two elements

<u>OXYACIDS</u> contains oxygen

- If the formula contains only nonmetals (and is not an ammonium compound or an acid), the compound is likely MOLECULAR

Examples:

 $P(1_{3}: BINARY MOLECULAR \\ Name: phosphorus trichloride \\ NH_{4} CI: DNIC (ammonium ion) \\ Name: ammonium chloride \\ Name: ammonium chloride \\ Name: ammonium chloride \\ NH_{4} CI: DNIC (ammonium ion) \\ Name: ammonium chloride \\ Name: ammonium chloride \\ NH_{4} CI: DNIC (ammonium ion) \\ Name: ammonium chloride \\ NH_{4} CI: DNIC (ammonium ion) \\ Name: ammonium chloride \\ NH_{4} CI: DNIC (ammonium ion) \\ Name: ammonium chloride \\ NH_{4} CI: DNIC (ammonium ion) \\ NH_{4} CI: DNIC (ammonium io$  $H_{3}PO_{H}$ : OXYACID (hydrogen, phosphate)  $Fe(OH)_{2}$ : IONIC (starts with a metal) Name: phosphoric acid

# CHEMICAL EQUATIONS

- are the "recipes" in chemistry

- show the substances going into a reaction, substances coming out of the reaction, and give other information about the process

$$\operatorname{MgCl}_{2}(\operatorname{aq}) + \operatorname{MgNO}_{3}(\operatorname{aq}) \xrightarrow{\vee} 2\operatorname{AgCl}(\operatorname{s}) + \operatorname{Mg(NO}_{3})_{2}(\operatorname{aq})$$

"vialde"

REACTANTS - materials that are needed fot a reaction

PRODUCTS - materials that are formed in a reaction

COEFFICIENTS - give the ratio of molecules/atoms of one substance to the others

PHASE LABELS - give the physical state of a substance:

- (s) -solid
- (I) liquid
- (g) gas

(aq) - aqueous. In other words, dissolved in water
