- <sup>92</sup> So far, we have
  - looked at how to determine the composition by mass of a compound from a formula
  - converted from MASS to MOLES (related to the number of atoms/molecules)
  - converted from MOLES to MASS

Are we missing anything?

- What about SOLUTIONS, where the desired chemical is not PURE, but found DISSOLVED IN WATER?

- How do we deal with finding the moles of a desired chemical when it's in solution?

- unit: MOLARITY (M): moles of dissolved substance per LITER of solution

M - molarity - moles of SOLUTE L SOLUTION 6,0 M HCI solution: 6,0 mol HCI

If you have 0.250 L (250 mL) of 6.0 M HCl, how many moles of HCl do you have? 6.0 mol HCl = L

★ See SECTIONS 4.7 - 4.10 for more information about MOLARITY and solution calculations (p 154 - 162 - 9th edition) (p 156-164 - 10th edition)

If you need 0.657 moles of hydrochloric acid, how many liters of 0.0555 M HCl do you need to measure out?

0.0555 mol HCI = L

$$0.657 \text{ mol } HC|X = \frac{L}{0.0555 \text{ mol } HC|} = \frac{11.8 \text{ Lof } 0.0555 \text{ M} HC|}{11.8 \text{ Lof } 0.0555 \text{ M} HC|}$$

In a lab setting, we're not likely to have 11.8 L of this solution (11800 mL), so we're not very likely to use this one to get 0.657 moles of HCI!

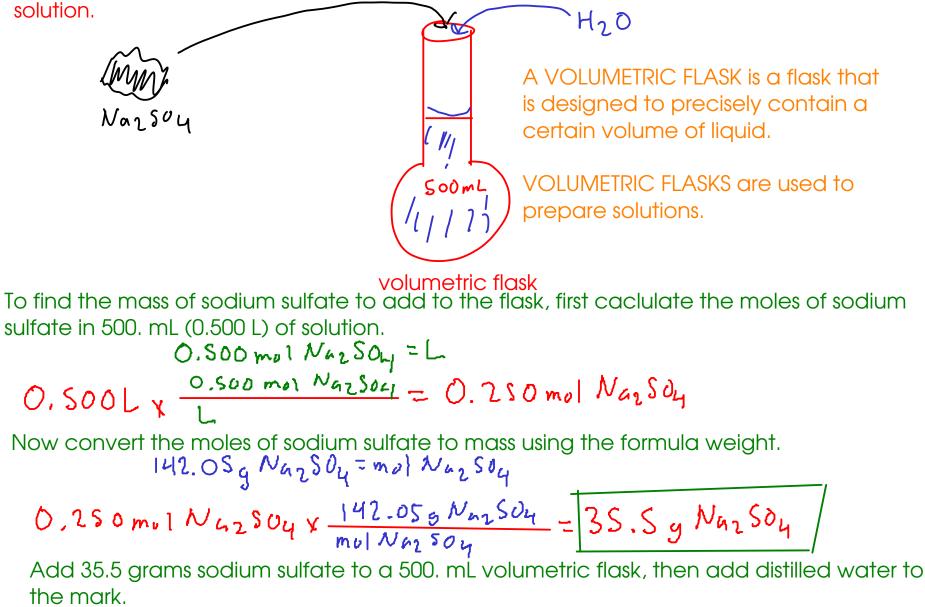

What if we used 6.00 M HCl? 6,00 mo | HC| = L

$$O.657 \text{ mol}HClx = O.110Lof6.00 \text{ M}Cl$$
  
 $G.00 \text{ mol}HCl$   
This one required only 110. mL to get  
the desired moles of HCl. Use this

one!

## Example: How would we prepare 500. mL of 0.500 M sodium sulfate in water? $N_{a_2} S_{u_1}$ : 142.05 g/mol

Dissolve the appropriate amount of sodium sulfate into enough water to make 500. mL of

## More on MOLARITY

To prepare a solution of a given molarity, you generally have two options:

Weigh out the appropriate amount of solute, then dilute to the desired volume with solvent (usually water)

## /---"stock solution"

Take a previously prepared solution of known concentration and DILUTE it with solvent to form a new solution

- Use DILUTION EQUATION

The dilution equation is easy to derive with simple algebra.

... but when you dilute a solution, the number of moles of solute REMAINS CONSTANT. (After all, you're adding only SOLVENT)

$$M_1 V_1 = M_2 V_2$$
  
before after Since the number of moles of solute stays the same, this equality must be true!

before diution after dilution

$$M_{1} \bigvee_{1} = M_{2} \bigvee_{2} \text{ ... the "DILUTION EQUATION"}$$

$$M_{1} \stackrel{?}{=} \text{ molarity of concentrated solution}$$

$$\bigvee_{1} \stackrel{?}{=} \text{ volume of concentrated solution}$$

$$M_{2} \stackrel{?}{=} \text{ molarity of dilute solution}$$

$$\bigvee_{2} \stackrel{?}{=} \text{ volume of dilute solution} \left( \frac{f_{0}f_{2}}{f_{0}} \sqrt{\frac{1}{2}} \sqrt{$$

$$V_1 = ?$$
  
 $V_2 = 150.mL$   
 $(0.500M)V_1 = (0.333M)(150.mL)$   
 $V_1 = 99.9mL of 0.500M Nm2Soy$ 

Measure out 99.9 mL of 0.500 M sodium sulfate solution, then add water until the total volume is 150 mL. (You can do this in a large graduated cylinder very quickly!)

- Chemical reactions proceed on an ATOMIC basis, NOT a mass basis!

- To calculate with chemical reactions (i.e. use chemical equations), we need everything in terms of ATOMS ... which means MOLES of atoms

- To do chemical calculations, we need to:

- Relate the amount of substance we know (mass or volume) to a number of moles

- Relate the moles of one substance to the moles of another using the equation
- Convert the moles of the new substance to mass or volume as desired

$$2 A(ls) + 3 Br_2(l) \longrightarrow 2 A(Br_3(s))$$

\* Given that we have 25.0 g of liquid bromine, how many grams of aluminum would we need to react away all of the bromine?

) Convert grams of bromine to moles: Need formula weight  $B_{r_2}$ :  $\frac{2 \times 74,96}{159.80}$ 159.80 g  $B_{r_2}$ : mol  $B_{r_2}$  $25,0g B_{r_2} \times \frac{mol B_{r_2}}{159.80} = 0.15645$  mol  $B_{r_2}$ 

Use the chemical equation to relate moles of bromine to moles of aluminum  $2 \mod A = 3 \mod B c_2$  $0.15645 \mod B c_2 \times \frac{2 \mod A }{3 \mod B c_2} = 0.10430 \mod A$ 

3 Convert moles aluminum to mass: Need formula weight A| = 26.98 26.98 A| = mol A|0.10430 mol  $A| \times \frac{26.98}{mol A|} = 2.81$  A|

## You can combine all three steps on one line if you like! $159.80_{g}B_{f_2} = mol B_{f_2}$ (2) $2mol A_{1} = 3mol B_{f_2}$ (3) $26.98_{g}A_{1} = mol A_{1}$

$$25.0g Br_{2} \times \frac{mol Br_{2}}{159.80g Br_{2}} \times \frac{2mol Al}{3mol Br_{2}} \times \frac{26.98g Al}{mol Al} = 2.81 g Al$$

$$(1) \qquad (2) \qquad (3)$$

Things we can do:

| If we have         | and we need | Use                                 |
|--------------------|-------------|-------------------------------------|
| MASS               | MOLES       | FORMULA WEIGHT                      |
| SOLUTION<br>VOLUME | MOLES       | MOLAR<br>CONCETRATION<br>(MOLARITY) |
| MOLES OF A         | MOLES OF B  | BALANCED<br>CHEMICAL<br>EQUATION    |

101 Example:

How many milliliters of 6.00M hydrochloric acid is needed to completely react with 25.0 g of sodium carbonate?

$$\frac{2}{2}H(1(aq) + Na_2(O_3(s) \rightarrow H_2O(l) + (O_2(g) + 2Nuc)(aq))$$

1 - Convert 25.0 g sodium carbonate to moles. Use FORMULA WEIGHT.

- 2 Convert moles sodium carbonate to moles HCI. Use CHEMICAL EQUATION.
- 3 Convert moles HCI to volume HCI solution. Use MOLARITY (6.00 M HCI)
