

$$M_1 V_1 = M_2 V_2 \quad \dots \text{the "DILUTION EQUATION"}$$

M_1 = molarity of concentrated solution

V_1 = volume of concentrated solution

M_2 = molarity of dilute solution

V_2 = volume of dilute solution (total volume, not volume of added solvent!)

The volumes don't HAVE to be in liters, as long as you use the same volume UNIT for both volumes!

Example: Take the 0.500 M sodium sulfate we discussed in the previous example and dilute it to make 150. mL of 0.333 M solution. How many mL of the original solution will we need to dilute?

$$M_1 V_1 = M_2 V_2$$

$$M_1 = 0.500 M \quad M_2 = 0.333 M$$

$$V_1 = ?$$

$$V_2 = 150. \text{ mL}$$

$$(0.500 M) V_1 = (0.333 M)(150. \text{ mL})$$

$$V_1 = 99.9 \text{ mL}$$

Take 99.9 mL of 0.500 M sodium sulfate, and add enough water to make 150. mL of solution!

CHEMICAL CALCULATIONS CONTINUED: REACTIONS

- Chemical reactions proceed on an ATOMIC basis, NOT a mass basis!
- To calculate with chemical reactions (i.e. use chemical equations), we need everything in terms of ATOMS ... which means MOLES of atoms

coefficients are in terms of atoms and molecules!

$$2 \text{ atoms Al} = 3 \text{ molecules Br}_2 = 2 \text{ formula units AlBr}_3$$

$$2 \text{ mol Al} = 3 \text{ mol Br}_2 = 2 \text{ mol AlBr}_3$$

- To do chemical calculations, we need to:
 - Relate the amount of substance we know (mass or volume) to a number of moles
 - Relate the moles of one substance to the moles of another using the equation
 - Convert the moles of the new substance to mass or volume as desired
