

MOLAR CONCENTRATION ✖

- unit: MOLARITY (M): moles of dissolved substance per LITER of solution

$$M = \text{molarity} = \frac{\text{moles of SOLUTE}}{\text{L SOLUTION}}$$

↖ dissolved substance

$$6.0 \text{ M HCl solution} = \frac{6.0 \text{ mol HCl}}{\text{L}}$$

If you have 0.250 L (250 mL) of 6.0 M HCl, how many moles of HCl do you have? $6.0 \text{ M HCl} \rightarrow 6.0 \text{ mol HCl} = \text{L}$

$$0.250 \text{ L} \times \frac{6.0 \text{ mol HCl}}{\text{L}} = \boxed{1.5 \text{ mol HCl}}$$

If you need 0.657 moles of hydrochloric acid, how many liters of 0.0555 M HCl do you need to measure out?

$$0.0555 \text{ M HCl} \rightarrow 0.0555 \text{ mol HCl} = \text{L}$$

$$0.657 \text{ mol HCl} \times \frac{\text{L}}{0.0555 \text{ mol HCl}} = \boxed{11.8 \text{ L}}$$

(11800 mL)

This volume's a bit large for lab work!

What if we used 6.00 M HCl?

$$6.00 \text{ M HCl} \rightarrow 6.00 \text{ mol HCl} = \text{L}$$

$$0.657 \text{ mol HCl} \times \frac{\text{L}}{6.00 \text{ mol HCl}} = \boxed{0.110 \text{ L}}$$

(110 mL)

Example: How would we prepare 500. mL of 0.500 M sodium sulfate in water?

Dissolve the appropriate amount of sodium sulfate into enough water to make 500. mL of solution.

$\text{Na}_2\text{SO}_4: 142.05 \text{ g/mol}$

A VOLUMETRIC FLASK is a flask that is designed to precisely contain a certain volume of liquid.

VOLUMETRIC FLASKS are used to prepare solutions.

volumetric flask

We will use the VOLUME and the MOLARITY to find out how many MOLES of sodium sulfate need to be dissolved. Then, we can convert MOLES to MASS using FORMULA WEIGHT.

$$0.500 \text{ mol Na}_2\text{SO}_4 = \text{L} \quad \text{mL} = 10^{-3} \text{ L}$$

$$500. \text{ mL} \times \frac{10^{-3} \text{ L}}{\text{mL}} \times \frac{0.500 \text{ mol Na}_2\text{SO}_4}{\text{L}} = 0.250 \text{ mol Na}_2\text{SO}_4$$

$$142.05 \text{ g Na}_2\text{SO}_4 = \text{mol Na}_2\text{SO}_4$$

$$0.250 \text{ mol Na}_2\text{SO}_4 \times \frac{142.05 \text{ g Na}_2\text{SO}_4}{\text{mol Na}_2\text{SO}_4} = 35.5 \text{ g Na}_2\text{SO}_4$$

Weigh 35.5 g sodium sulfate into 500 mL volumetric flask, then add water to the mark.

More on MOLARITY

To prepare a solution of a given molarity, you generally have two options:

① Weigh out the appropriate amount of solute, then dilute to the desired volume with solvent (usually water)

② Take a previously prepared solution of known concentration and DILUTE it with solvent to form a new solution

"stock solution"

- Use DILUTION EQUATION

The dilution equation is easy to derive with simple algebra.

$$M \times V$$

$$\frac{\text{mol}}{\text{L}} \times \text{L} = \text{moles solute}$$

... but when you dilute a solution, the number of moles of solute REMAINS CONSTANT. (After all, you're adding only SOLVENT)

$$M_1 V_1 = M_2 V_2$$

before
dilution

after
dilution

Since the number of moles of solute stays the same, this equality must be true!

$$M_1 V_1 = M_2 V_2 \quad \dots \text{the "DILUTION EQUATION"}$$

M_1 = molarity of concentrated solution

V_1 = volume of concentrated solution

M_2 = molarity of dilute solution

V_2 = volume of dilute solution (total volume, not volume of added solvent!)

The volumes don't HAVE to be in liters, as long as you use the same volume UNIT for both volumes!

Example: Take the 0.500 M sodium sulfate we discussed in the previous example and dilute it to make 150. mL of 0.333 M solution. How many mL of the original solution will we need to dilute?

$$M_1 V_1 = M_2 V_2$$

$$(0.500 \text{ M}) V_1 = (0.333 \text{ M})(150. \text{ mL})$$

$$V_1 = 99.9 \text{ mL of } 0.500 \text{ M Na}_2\text{SO}_4$$

$$M_1 = 0.500 \text{ M} \quad M_2 = 0.333 \text{ M}$$

$$V_1 = ? \quad V_2 = 150. \text{ mL}$$

Measure out 99.9 mL of 0.500 M sodium sulfate, then add enough water to get a total volume of 150. mL (could do this in a graduated cylinder!)

CHEMICAL CALCULATIONS CONTINUED: REACTIONS

- Chemical reactions proceed on an ATOMIC basis, NOT a mass basis!
- To calculate with chemical reactions (i.e. use chemical equations), we need everything in terms of ATOMS ... which means MOLES of atoms

coefficients are in terms of atoms and molecules!

- To do chemical calculations, we need to:
 - Relate the amount of substance we know (mass or volume) to a number of moles
 - Relate the moles of one substance to the moles of another using the equation
 - Convert the moles of the new substance to mass or volume as desired

* Given that we have 25.0 g of liquid bromine, how many grams of aluminum would we need to react away all of the bromine?

① Convert grams of bromine to moles: Need formula weight $\text{Br}_2 : \frac{2 \times 79.90}{159.80}$

$$159.80 \text{ g Br}_2 = \text{mol Br}_2$$

$$25.0 \text{ g Br}_2 \times \frac{\text{mol Br}_2}{159.80 \text{ g Br}_2} = 0.15645 \text{ mol Br}_2$$

② Use the chemical equation to relate moles of bromine to moles of aluminum

$$2 \text{ mol Al} = 3 \text{ mol Br}_2$$

$$0.15645 \text{ mol Br}_2 \times \frac{2 \text{ mol Al}}{3 \text{ mol Br}_2} = 0.10430 \text{ mol Al}$$

③ Convert moles aluminum to mass: Need formula weight $\text{Al} : 26.98$

$$26.98 \text{ g Al} = \text{mol Al}$$

$$0.10430 \text{ mol Al} \times \frac{26.98 \text{ g Al}}{\text{mol Al}} = \boxed{2.81 \text{ g Al}}$$

You can combine all three steps on one line if you like!

$$25.0 \text{ g Br}_2 \times \frac{\text{mol Br}_2}{159.80 \text{ g Br}_2} \times \frac{2 \text{ mol Al}}{3 \text{ mol Br}_2} \times \frac{26.98 \text{ g Al}}{\text{mol Al}} = 2.81 \text{ g Al}$$

① ② ③

Things we can do:

| If we have ... | ... and we need ... | Use ... |
|-----------------|---------------------|--------------------------------|
| MASS | MOLES | FORMULA WEIGHT |
| SOLUTION VOLUME | MOLES | MOLAR CONCENTRATION (MOLARITY) |
| MOLES OF A | MOLES OF B | BALANCED CHEMICAL EQUATION |

Example:

How many milliliters of 6.00M hydrochloric acid is needed to completely react with 25.0 g of sodium carbonate?

-
- 1 - Convert 25.0 g sodium carbonate to moles. Use FORMULA WEIGHT.
 - 2 - Convert moles sodium carbonate to moles HCl. Use CHEMICAL EQUATION.
 - 3 - Convert moles HCl to volume solution. Use MOLARITY (6.00 M)
-

① Na_2CO_3 : Na - 2×22.99

C - 1×12.01

O - 3×16.00

$$\frac{105.99 \text{ g Na}_2\text{CO}_3}{\text{mol Na}_2\text{CO}_3}$$

$$25.0 \text{ g Na}_2\text{CO}_3 \times \frac{\text{mol Na}_2\text{CO}_3}{105.99 \text{ g Na}_2\text{CO}_3} = 0.2358713086 \text{ mol Na}_2\text{CO}_3$$

② $2 \text{ mol HCl} = \text{mol Na}_2\text{CO}_3$

$$0.2358713086 \text{ mol Na}_2\text{CO}_3 \times \frac{2 \text{ mol HCl}}{\text{mol Na}_2\text{CO}_3} = 0.4717426172 \text{ mol HCl}$$
