Measurements

Measurements are comparisons of properties against accepted standards, called units.

ENGLISH / US SYSTEM OF UNITS:

So what's the problem?

- 1) English units for the same type of measurements (like length) were all created separately and don't relate to each other in easy-to-remember ways.
- 2) Conversion math gets ugly ... (Dividing by 1760 in your head isn't easy!)

English units are nonstandard and difficult to use. Solution? THE METRIC SYSTEM

Metric Base Units:

Ler	Length		m
Mass		X kilogram	kg
Temperature		Kelvin	K
Tir	me	second	S

All metric units are made up of COMBINATIONS of BASE UNITS!

*we usually treat the gram as if it's the base unit for mass!

- One meter is approximately 3.3 feet.
- One kilogram is approximately 2.2 pounds.

What about SIZE?

A few common metric prefixes:

mega-	10 6	М
kilo-	3 10	k
centi-	-2.	С
milli-	10 3	m
micro-	10 -6	M

Bigger units

MEMORIZE the common metric prefixes listed in the study

Applying prefixes

$$\frac{1}{1} = \frac{m}{m} = \frac{m}{1000} \left(\frac{1}{100} m \right)$$

$$\frac{1}{1} = \frac{m}{1000} = \frac{m}{1000} \left(\frac{1}{100} m \right)$$

The distance between here and Columbia, SC is about 107,000 meters. What metric unit would be best suited for a distance like this?

$$K = 10^3 (1000)$$

By "best suited", we mean a metric unit that would represent the number without many beginning or end zeros. These kinds of numbers are easier for us to remember!

A piece of chalk is 0.080 meters long. What metric unit would be best suited for this length?

(= 10 (1/100)

Derived Units

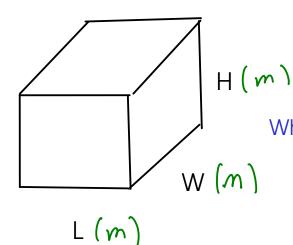

- are units that are made up of combinations of metric base units with each other and/or with prefixes

$$velocity: \frac{miles}{hr} \quad \frac{km}{s} \qquad \left(\frac{m}{s}\right) \qquad \frac{length}{time}$$

Two derived units are particularly important in general chemistry:

- 1) VOLUME
- 2) DENSITY

VOLUME

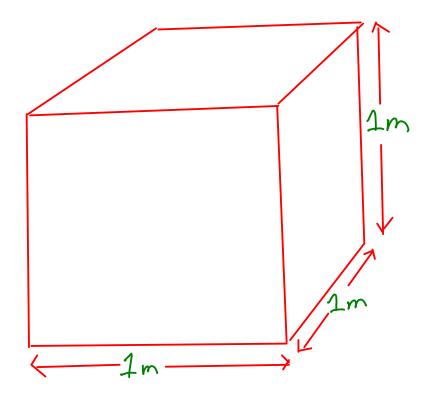

$$VOLUME = L \times W \times H$$

What are the units of volume in the metric system?

VOLUME =
$$(m) \times (m) \times (m)$$

= m^3 "cubic meters"

Problem: Cubic meters are much too large for laboratory-scale work!

Solution ... scale it down!

Practical issues for volume units

- Cubic meters are too large! A meter is very similar in length to a yard, so a cubic meter is a cube that is approximately a yard long on each side!

Cubic <u>decimeters</u> are given the name <u>"liters"</u>, abbreviation "<u>L</u>" In the lab, we typically need an even smaller unit than the liter, so we use <u>milliliters</u> (mL)

7

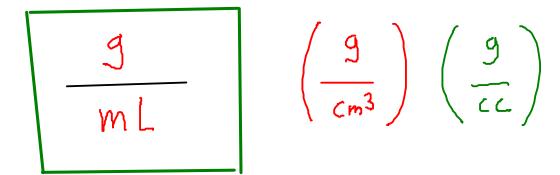

DENSITY

- Density is a measure of the concentration of matter; of how much matter is present in a given space
- Density is defined as the MASS per unit VOLUME, or ...

... but we have the same problem here that we had with the cubic meter itself ... it's too big!

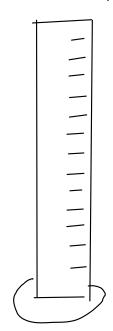

9

In the lab, we typically measure masses as grams and volumes as milliliters, so the density unit we will use most often is:

A useful density to remember: WATER at room temp: Density = 1 2/mL

... of a liquid

1) Measure mass of empty cylinder

mass = 97.35 g

2) Fill cylinder and measure volume of liquid

volume = 25.3 mL

3) Measure mass of filled cylinder

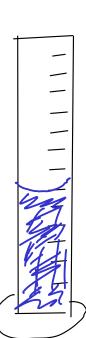

4) Subtract to find mass of liquid

5) Density = mass liquid / volume liquid

11

1) Measure mass of object

2) Partially fill cylinder with liquid, record volume.

4) Subtract to find volume of object

5) Density = mass object / volume object

Density =
$$\frac{7.78}{1.6}$$
 mL
$$= \frac{9}{mL}$$

Converting from one unit to another

We will use the method of dimensional analysis, sometimes called the factor-label method. ... or, the "drag and drop" method!

Dimensional analysis uses conversion factors to change between one unit and another

What's a conversion factor? A simple equality.

Conversion factors in metric

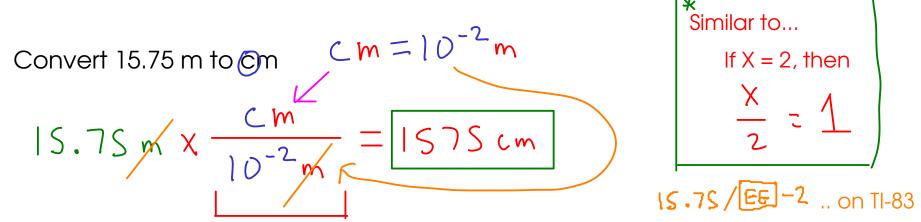

In the metric system, conversion factors between units may always be made from the metric prefixes!

For example, "
$$K_{10}$$
" means 10^{3}
 $K = 10^{3}$

So

 $K_{g} = 10^{3}$
 $K_{L} = 10^{3}$
 $K_{m} = 10^{3}$
 $K_{m} = 10^{3}$
 $K_{m} = 10^{3}$
 $K_{m} = 10^{3}$

How do we actually USE a conversion factor?

* This fraction equals one, so multiplying by it does not change the VALUE of the number, only its UNITS!

Convert 0.01893 kg to g

DRAG AND DROP

- Drag the part of the factor that contains the unit you want to get rid of (cancel out) to the BOTTOM.
- Then, drag the other half of the factor to the TOP
