## REAL GASES

- The empirical gas laws (including the ideal gas equation) do not always apply.
- The gas laws don't apply in situations where the assumptions made by kinetic theory are not valid.
- When would it be FALSE that the space between gas molecules is much larger than the molecules themselves?
- at high pressure, molecules would be much closer together!
- When would it be FALSE that attractive and repulsive forces would be negligible?
- at high pressure, attractions and repulsions should be stronger!
- at low temperature, attractions and repulsions have a more significant affect on the paths of molecules fast (high $T$ ) slow (low T)

-The gas laws are highly inaccurate near the point where a gas changes to liquid!
- In general, the lower the pressure and the higher the temperature, the more IDEAL a gas behaves.
