$$A + H_{2}0 \rightleftharpoons H_{3}0^{+} + A^{-}$$

$$K_{\alpha} = \frac{[H_{3}0^{+}][A^{-}]}{[HA]}$$

$$(1) \text{ Take log of both sides}$$

$$(2) \text{ Multiply by -1}$$

$$(3) \text{ Rearrange, solving for pH}$$

$$PH = PK_{\alpha} + \log\left(\frac{[A^{-}]}{[HA]}\right) \vdash \text{Henderson-Hasselbalch}$$
Equation
$$[A^{-}] \dots \text{ from the salt}$$

$$[HA] \dots \text{ from the weak acid}$$

- We ASSUME that the initial concentrations of both the acid and its conjugate are equal to the equilibrium concentrations. Valid IF there are significant amounts of both species initially.

$$PH = pK_{a,acidit} + \log\left(\frac{[bosic species]]}{[acidic species]}\right) + \frac{Henderson-Hasselbalch}{Equation}$$

$$\frac{ex:acidic b u Ffer}{H(2H_3O_2 / Na(2H_3O_2) - Hasselbalch)}$$

$$PH = pK_{a,H(2H_3O_2)} + \log\left(\frac{[(2H_3O_2)]}{[H(2H_3O_2)]}\right)$$

$$\frac{\text{ex: basic buffer}}{\text{NH}_3 / \text{NH}_4 \text{NO}_3}$$

$$pH = pKa_{, \text{NH}_4^+} + \log\left(\frac{\text{[NH}_3]}{\text{[NH}_4^+]}\right)$$

¹⁵⁰ Calculate the pH of a buffer made from 30.2 grams of ammonium
chloride (FW = 53.492 g/mol) and 29 mL of 18.1 M ammonia diluted to 150. mL with water.

$$\begin{array}{c}
PH = P K_{\alpha_{1} \alpha_{1} \cdot k_{1}} + \log \left(\frac{\sum basic \epsilon(\epsilon cias)}{[\alpha cikic species]} \right) \\
Henderson-Hasselbalch Equation
\end{array}$$
Calculate initial concentrations of ammonia and ammonium ion:

$$\begin{bmatrix}
NH_{3}]; & n_{1}v_{1} = M_{2}v_{2} & (dilution) & (18.1 m)(29 mL) = M_{2}(150.mL) \\
M_{2} = 3.49933333 m N^{H_{3}}
\end{array}$$

$$\begin{array}{c}
\hline
NH_{4}^{+}]; & 30.2 g NH_{4}C| \times \frac{mul NH_{4}Cl}{(53.492g NH_{4}Cl)} = 0.5(64570403) mul NH_{7}Cl \\
\hline
0.5(64570403) mul NH_{7}Cl \\
\hline
0.5(64570403) mul NH_{7}Cl \\
\hline
0.5(50 L
\end{array}$$

$$\begin{array}{c}
\hline
PK_{\alpha}: & \begin{pmatrix}
K_{b_{1}} NH_{3} = 1.8 \times 10^{-5}; & pK_{\alpha} + pK_{b} = 141.00 \\
pK_{\alpha}: & 4.74; & pK_{\alpha} + 4.74 = 14.00; & pK_{\alpha} = 9.26 \\
\hline
PH = 9.26 + \log \left(\frac{3.49933333}{3.76380268} m \right) = 9.23
\end{array}$$

¹⁵¹ BUFFER SELECTION

- Buffer pH is controlled by the pKa of the acidic species in the buffer.

- Choose a buffer system so that the desired pH is within +/- 1 pH unit of the pKa

- You also need to ensure that the components of the buffer do not interact with your chemistry!

BUFFER PREPARATION

- many buffers are prepared by mixing specific amounts of both components of the Buffer system (acid / conjugate base or base / conuugate acid)

Some buffer "recipes" call for making the conjugate ion FROM the weak acid or base ... by adding a STRONG acid or base!

$$NH_3 + H_{NO_3} \longrightarrow NH_4^+ + NO_3^-$$

The reaction of the strong acid with the weak base goes essentially to completion!

If you have more ammonia than nitric acid, you will end up with a solution containing a significant amount of both ammonia and ammonium ion ... a buffer!

BUFFER CAPACITY

- A buffer is good only as long as there is a significant concentration of both the acidic and basic species

- buffer capacity: how much acid or base can a buffer resist before losing its ability to buffer

- Buffer pH depends on the RATIO of acid to base!

$$PH = pK_{a,acidic} + log\left(\frac{[basic = lecias]]}{[acidic species]}\right) + Henderson-HasselbalchEquationRatio determines pH; the actual concentrations don't!$$

- So, if you make a buffer with 1.0M HA and 1.0M A-, it will have the same pH as a buffer with 2.0M HA and 2.0M A- but the 2M buffer will have a higher BUFFER CAPACITY - it will resist more additions of acid or base.

Buffer calculation: Tris buffer - Tris(hydroxymethyl)-aminomethane
